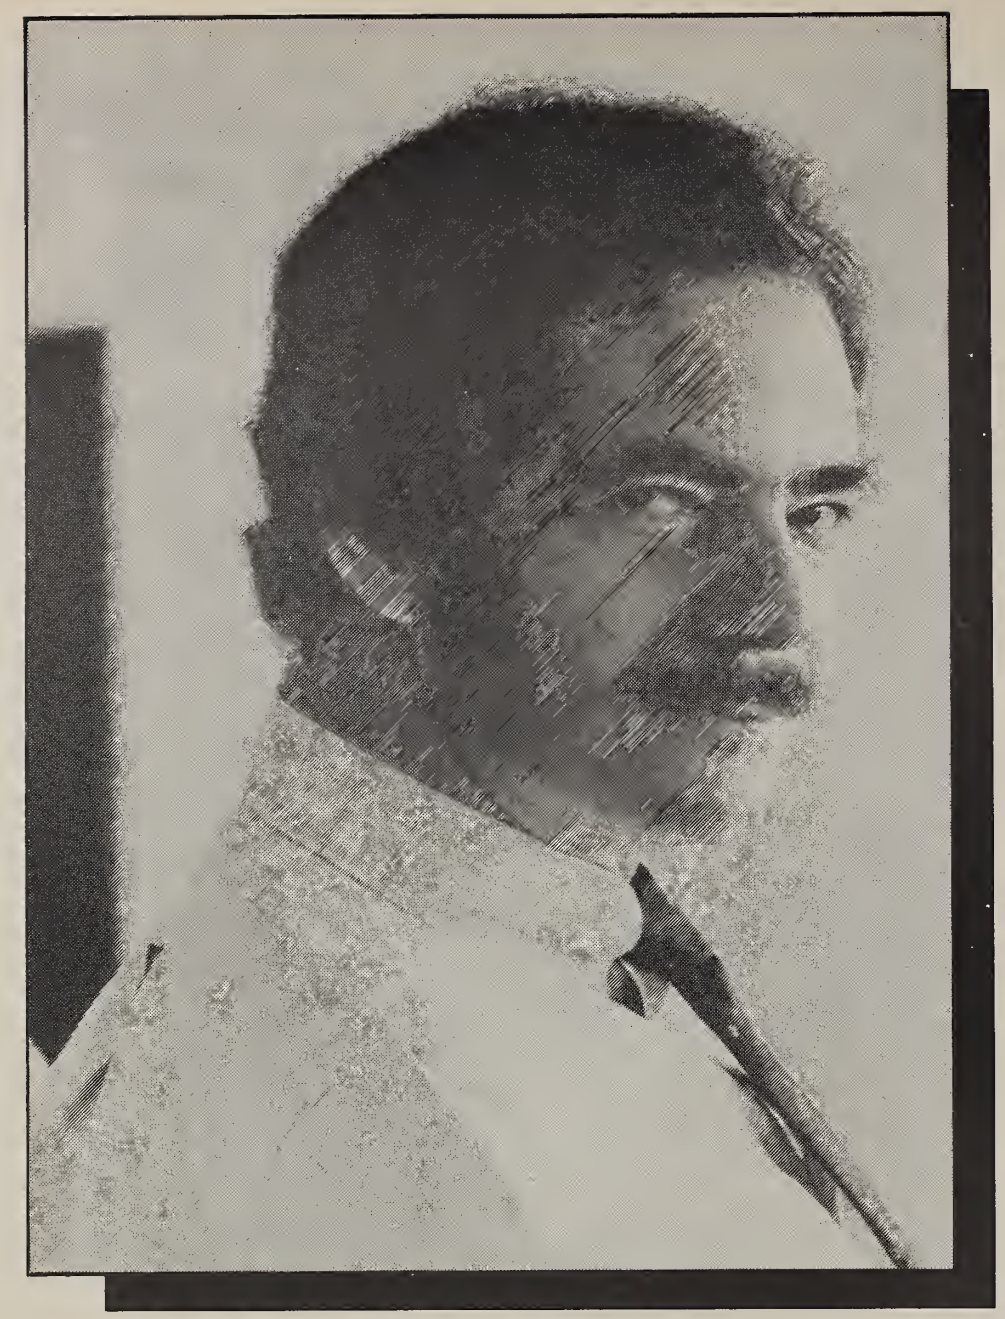
BUSINESS REVIEWS

Paperback Software, Nutshell

NEW COLUMNS

For CP/M And Macintosh



I'm Adam Osborne. I want you to know that you no longer have to pay ridiculous prices for top quality software.

***Yes,* you can get full-featured word processing for under seventy dollars.** So don't be fooled. The next time a sales person tells you an advanced word processor costs $400, he's either ignorant or putting his commission before your pocketbook.

Most software companies believe in *"perceived value pricing"*. If a software package saves you thousands of dollars, they argue, why shouldn't you pay hundreds for it—even though the program costs just a few dollars to produce. Based on that logic, a telephone should cost $500! After all, it saves you thousands in travel costs.

High software prices are currently maintained by a shaky coalition of software companies and some computer stores. **You've had no choice but to pay exorbitant prices whenever you bought software for your personal computer.**

I founded Paperback Software International to give you an alternative—Quality Software at Affordable Prices!

Ask for the Paperback Software alternative at your local bookshop, computer store, or software store. Or use the order form below.

NUMBER WORKS
The spreadsheet for budgeting, financial planning, expense reports, homework. Do *"what if?"* calculations, spot trends. 40 built-in math and finance functions. Spreadsheets can be as large as disk, not limited by memory like other programs. IBM PC w/128K, PCjr w/256K.

EXECUTIVE WRITER
Advanced word processing with word wrap, global search and replace, horizontal scrolling, centering and right justification, on-screen bold and underlining, headers, footers, footnotes, indices and tables of contents, macros, graphics. IBM PC w/128K, PCjr w/256K.

EXECUTIVE FILER
An electronic file cabinet. Keep anything you write organized and available at a keystroke. Combine with *Executive Writer* to switch between documents and filecards at a keystroke. Look up references. Do document assembly. Use *MailPrint* to generate form letters. IBM PC w/192K, PCjr w/256K.

DRAW-IT
Turns your computer into a full color electronic drawing board. Make pictures and illustrations, pie, bar, and line graphs, or just have fun! Easy-access help screens, simple commands, ready-to-use pictures and patterns. IBM PC w/128K, PCjr w/256K, color graphics card.

PAPERBACK WRITER
The affordable high-value word processor for everyday use. Easy-to-read instruction book makes you productive in minutes. Block operations, horizontal scrolling, word wrap, on-screen bold and underlining, search and replace. IBM PC w/128K, PCjr w/256K.

MY ABC's
Six educational games that are simple to learn and fun to play for preschoolers. They teach your child to recognize letters, count, and develop concentration skills. IBM PC/PCjr w/128K, color graphics card.

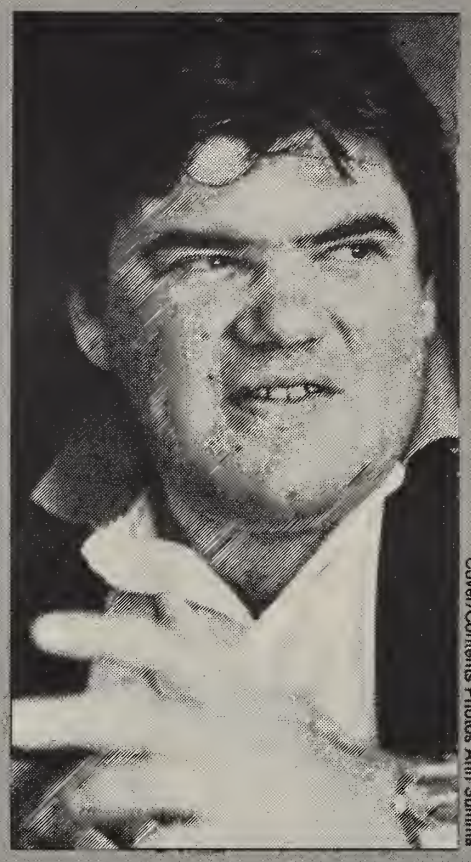
COVER STORY



Cover/Contents Photos Ann Summa

32
Borland's Philippe Kahn:

Surprising People And Disturbing The Establishment

By Jeff Spurrier

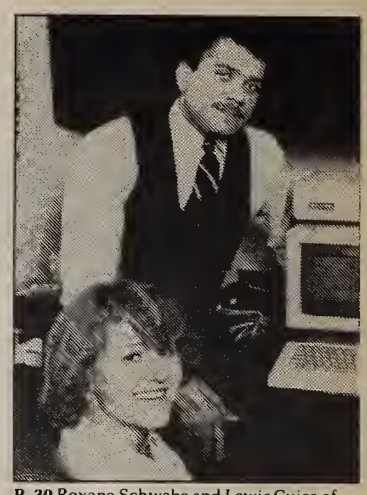
The outspoken president of Borland, which pioneered the concept of low-priced, useful software with *Turbo Pascal* and *Sidekick*, holds forth on what's wrong with the industry, Borland's philosophy, and why the company remains viable while breaking all the rules.

FEATURES

23
The Cracker Speaks: Confessions Of A Computer Criminal

By Don Hamilton and Mike Markowitz

Some excerpts from last fall's interview with The Cracker, né Bill Landreth, ex-computer felon and author of *Out Of The Inner Circle*.



P. 30 Roxane Schwabe and Lewis Guice of The NetWorkers. Photo: Pat Johnson Studios.

30
The Networkers: Information Systems And Services For A Changing World

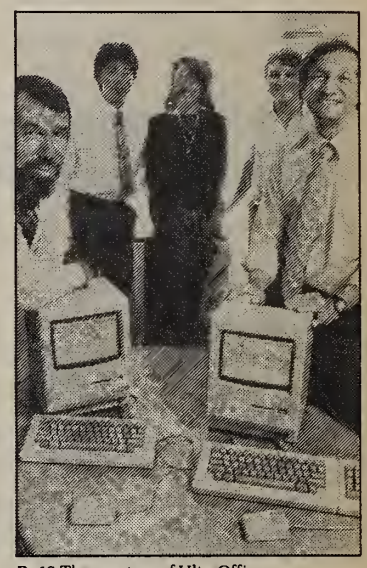
By Ken Goehner

A network of Macintosh and Lisa users takes the first step towards global communication.

42
UltraOffice: Linking Unix With The Macintosh Office

By Carter George

If you love the versatility and multi-tasking abilities of Unix and the friendliness of Macintosh, here's the best of both worlds.



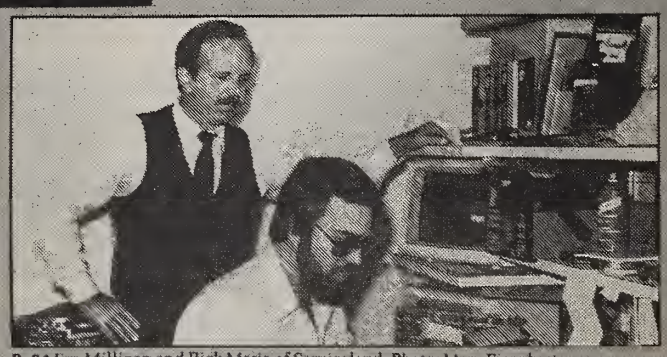
P. 42 The creators of UltraOffice. Photo: Ann Summa

54
Meter Readers Join The Micro Revolution

By Robin J. Dunitz

No more forms in triplicate for Southern California Edison's meter readers — now they're using handheld (and dog-proof) computers.

THE MICROTIMES SURVEY



P. 24 Jim Milligan and Rick Maria of Serviceland. Photo: Mary Eisenhart

24
Service And Repair: *Who You Gonna Call?*

By Mary Eisenhart

Sooner or later, something in your system isn't going to be working right. Here are some suggestions for finding help.

COLUMNS

P. 8 Steve Jobs of Apple. Photo: Chris Stewart/San Francisco Chronicle

8
Edit Mode

By Don Hamilton

Ratings of 10 best MS-DOS business software packages, what's up at Apple, and more.

23B
Mac News

By Barbara Leone

What's new with the latest versions of Macintosh Finder, *MacWrite* and *MacPaint*.

P. 60 Russell Lieblich

55D
CP/Machinations

By Robert D. Athey, Jr.

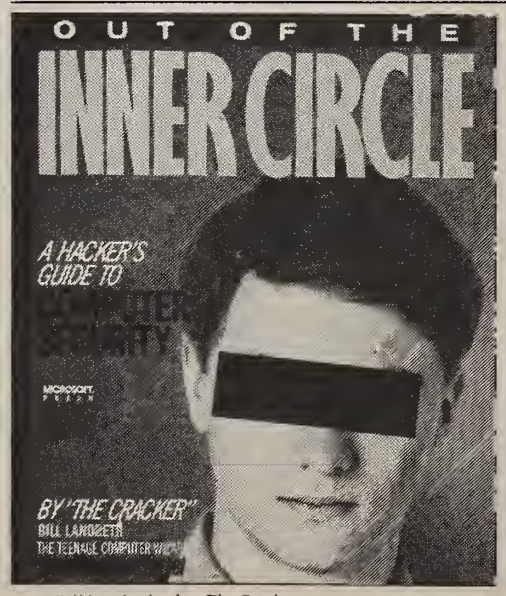
NEWSWEEP, available from most CP/M user groups, can make your life a whole lot easier.

60
Sweet Savage Byte

By Jina Bacarr

Our Jina interviews Russell Lieblich, creative force behind *Web Dimension* and *Master Of The Lamps*, and reports the resulting encounter from his (somewhat hypothetical) perspective.

DEPARTMENTS



P. 56 Bill Landreth a.k.a. The Cracker

14
Business Software

Reviews of Paperback Software's office programs; also *Intuit*, *Nutshell*, and more.

55
New Products

A Braille-keyboard-and-display lap computer for blind users; new graphics software for Apple; compilers that let you speed up your slow-running d-*Base III* or program in C on your Macintosh; more.

Prices subject to change without notice. All goods are new, include warranty and are guaranteed to work. Due to low prices and our assurance that you will get new, unused products — **all sales are final.** We do not guarantee compatibility. Call before returning goods for repair or replacement.

AD # 12

HOW TO BUY SOFTWARE WHEN ALL THE ADS LOOK THE SAME.

We know it's hard to choose a software house. All the ads say the same thing—"Lowest prices," "fastest delivery," "best support," "biggest inventory."

Trouble is, although the claims are the same, the companies are very different. Which is why we want you to know some important facts about *us:*

1. 800-SOFTWARE is one of the oldest and most reputable firms in the industry. Our customers include Coca-Cola, GE, Hewlett-Packard, Xerox, AT&T, and thousands of other satisfied buyers.

2. Our National Accounts Program offers volume discounts and valuable services to large software users. We offer *incredibly* low prices on large bids!

3. We have a giant, $1,000,000 inventory. Which means we can offer next-day delivery if needed.

4. With every product you get friendly, expert technical support. Have a question? You'll be glad you bought from 800-SOFTWARE!

5. We'll match our competitors' prices on most products. We *never* cut service.

6. We never charge extra for credit card purchases, nor do we process for payment until the product is shipped. (Our competitors don't make this claim!)

7. You'll automatically receive our Technical Support Newsletter—a great way to stay up-to-date.

8. We are members of the Better Business Bureau and the Direct Marketing Association.

9. We want your business. *And* your repeat business. Which is why we work so hard to keep you happy. Give us a call and let us *prove* it!

Top Ten IBM Business Programs

The top ten MS-DOS business programs rated on a one to ten scale:

Program	Ease of Learning	Performance	Worth the Price
Framework	7.5	9	8
Sidekick	8.5	8.5	9.9
PC Paint	9.0	9.0	8
Lotus 123	8.0	9.0	8.5
Wordperfect	8.5	8.8	8.5
Supercalc 3 Ver 2	8.0	8.5	8.5
dBaseIII	7.5	8.0	8.0
Harvard Total Project	7.5	8.0	7.5
Timeline	7.5	8.0	7.5

We rate all these programs very highly. Any rating over seven is excellent. *Framework* could be the only business program you ever buy! However, our feeling is that no program can be as good for every use as a combination of individually suited programs. For some people, *Supercalc 3 Ver 2* along with *Sidekick* might be a better combination. With *Sidekick* you can use a modem, a word processor for letter writing, and a calendar. However, if you need a dictionary, *Wordperfect* has one of the best. *Sidekick* itself has no dictionary, but will also run with *Wordperfect*. *Sidekick* should be considered as an enhancement for any of these programs. The price of the program is about the same as the cost of a calculator (which is also provided at a keystroke as a part of the package.)

Project management programs are a must in any business environment. Very often the difference between failure and success can be simply understanding the magnitude of the project. Both the listed management programs will calculate critical paths, which will help you understand which projects can be done concurrently and which are dependent on others. Any change made to dates, time, or resource results in a recalculation of the critical path.

If the above programs were the only ones offered, they would be enough to justify computerization of most offices. They will also lead to enormous productivity improvement in any conceivable environment.

Apple: Trouble In Paradise

Just as the dust seemed to be settling at Apple (and just as we were going to press, unfortunately), President and CEO John Sculley set the computer world reeling again by ousting Apple co-founder, Chairman of the Board and head of the Macintosh Division Steve Jobs from any position of real power; although Jobs retains most of his titles and remains one of Apple's chief stockholders, no personnel are directly responsible to him under the company's current configuration. Speculation is rampant as to what this all means; no statements were forthcoming from Apple by press time. More next month — stay tuned.

Apple has been sending confusing signals to all the Apple watchers. The new business line with the Macintosh XL at the vanguard was announced just a few weeks ago. Now the Macintosh XL has been cancelled.

Some of Apple's middle management has been defecting (to say nothing of Steve Wozniak). Does all this mean that Apple is in trouble? I don't think so. I think there is, simply put, too much change happening in too short a period of time for some of the Apple employees. Apple has to change its image from an entertainment company to a business company if they want to compete with IBM. That kind of a change is likely to show the symptoms mentioned above in the giant computer company. Resistance to change is generally very great.

PHOTO: CHRIS STEWART/SAN FRANCISCO CHRONICLE

Apple's Steve Jobs (foreground) and John Sculley in somewhat happier times.

Apple has taken on several larger companies in the past and come up a winner. They have continued to show creative management style and innovation, and there is more than a little evidence that the "Macintosh Environment" is the wave of the future.

I wouldn't sell any of my stock over a little change at Apple. Change is good in this industry.

US Supercomputer Goes To Japan

According to the *LA Times*, Nissan Motor announced that it will buy a supercomputer from Cray Research of Minneapolis. Hitachi, the Japanese company offering a competing computer, was beat out by Cray.

All the complaining about the Japanese government putting so much money into and controlling the direction of the computer industry bothers me considerably. The complainers about Japan and their "government intervention" seem to overlook US government intervention.

If Kennedy had not decided to go to the moon we would have waited at least 10 more years for the microprocessor that we all know and love today. If you think about it, the US government spends large amounts of money on high technology research and development, amounts unmatched by the Japanese government.

The "Star Wars" weapon development that is about to occur will probably have a bigger impact on high technology and computers than the first "Space Race." This development will be financed by the US government — $1,000,000,000,000!!! All that money to pack small, smart, and power into spaceships. Europe is scared stiff that they will be left behind in the technological leap this will cause.

The Japanese are our friends, and good friendly competition is good for this country. Look what it did for the auto industry. After the auto industry decided to stop ignoring the Japanese imports and compete with them we have seen much better cars from Detroit.

Look Out *Jazz* Here Comes *Excel*

When Lotus' *Jazz* makes its long-awaited appearance (due this month), it will be greeted by a rival — Microsoft's *Excel* for the Macintosh. Expected to sell for $395, it is likely to offer *Jazz*, which will sell for $595, some serious competition for the number one spot on the charts.

New Chapter For English Hackers

In England two computer hackers were arrested in March by Crosspool City Police from the fraud squad (I like the name). The police waited outside the house of one of the men for a signal from the British Telecom officials.

South Yorkshire police carried out a similar operation with warrants under the "Forgery and Counterfeiting Act." Two men were also arrested and taken to Central London police station; all the involved computer equipment was seized.

The most well known breakin in England was into Prince Philip's electronic mailbox.

It was said that the raids astonished the close-knit and highly "secretive society" of hackers.

MSX To Microsoft: See You In Court

MSX Corporation filed a complaint in Federal Court April 3, 1985 seeking injunctive relief and damages from Microsoft Corporation for the use of the MSX trade name. The mark has been used by MSX Corporation since 1982, according to MSX.

MSX Corporation sells and services microcomputers for large corporate customers from its offices in the San Francisco Bay area, the Los Angeles area, and Oklahoma City. Their business is marketing personal computer products to large corporations.

More Memory For Your Spreadsheets

Intel announced an expanded memory board for the popular spreadsheet programs. Lotus's new *Lotus 1-2-3 ver2* will be able to take advantage of the expanded memory. Don't worry if you want to use *Framework* or one of the other popular spreadsheet programs — most of them will also

Meet the **TURBO 286, and XT**

KARON TECHNOLOGIES is proud to introduce you to our IBM compatible computer systems.

(model 286 shown here)

If you are in the market for an IBM PC or any other personal computer, Karon Technologies has systems manufactured here in Santa Clara that will out perform any competitor in every way.

* Karon systems run all IBM Software and expansion products

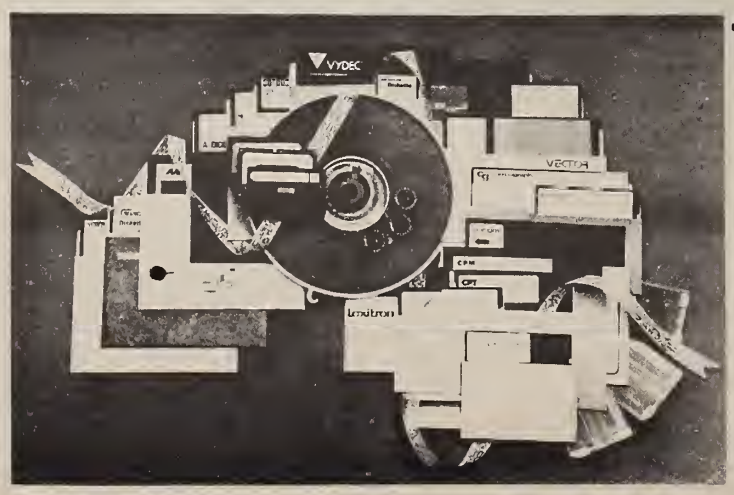
* Karon systems operate with greater efficiency and speed

* Karon systems cost 20-30% less than competitive systems

* Karon systems are manufactured and serviced right here in Santa Clara!

Let us put you behind one of these systems: **call KARON TECHNOLOGIES at (408) 246-6823**

ELECTRONIC MEDIA CONVERSION SERVICES



To/From over 200 Systems

Reliable and cost effective conversions for word processors, pc's, 9-track tapes, phototypesetters and mag cards. Optical scanning services. New, low prices for many conversions. Ask about our new Wordstar, Multimate, and Display Write capabilities. Tests available. We provide quality service at competitive prices.

TEXT SCIENCES CORPORATION

(formerly Datascan)

2716 Ocean Park Blvd
Santa Monica, CA 90405-5211

213•452•9114

Since 1979 over 200 BILLION characters converted.

EDIT MODE

be able to take advantage of the new board. The version of *Symphony* that takes advantage of the new board should be available in July of this year. Ashton-Tate's *Framework* support will be available in the third quarter of 1985.

Lotus 1-2-3 currently uses a lot of memory by saving empty cells in a fashion which is very memory-intensive. Well, guess what! *Lotus version 2* with the new Intel board should eliminate your problem forever. Whatever amount of memory is available will be consumed (somebody's law) — it wasn't long ago that 64K was a lot of memory. Today on the current crop of computers 512Kb or 640Kb of memory can seem confining.

The new memory products are called Above Board/PC and Above Board/AT. Each board is expandable to 2M-bytes. An IBM PC or PC-XT system can be expanded up to 8M-bytes. The AT boards, at 4M-bytes each, can expand your AT up to 8M-bytes.

Of course the spreadsheets today consume most of the available memory for the average PC. With this new product, I would think one of them would offer a prize to the user who meaningfully fills the entire available memory first.

The Above Board/PC retails for $395 with 64K-bytes and $595 with 256K-bytes, Above Board/AT for $595 with 128K-bytes and $995 for 512K-bytes. For more information contact Connie Barr (503) 629-7369 at INTEL Corporation.

Infoworld Changes To Tabloid Format

Infoworld editor James E. Fawcette says the upcoming change is "in response to customer requirement for timely news coverage." I tend to think the shortage of ads in the magazine has more to do with the change than meeting the needs of the readers. Philippe Kahn appears to be buying a little better than 15% of the full page ads currently in the mag.

Eagle Computer Goes To Korea

Eagle Computers intends to begin moving its manufacturing operation to Korea. At least 80% of their operation will be moved to Asia. As in so many other aspects of the computer industry this year, price competition has become the only way to survive. Eagle thinks that the move will make them competitive enough to bring their company back to life.

If you haven't checked recently, Eagle makes some excellent machines and the price recently has been very good. Good luck to Eagle.

Correction

Last April we ran a review of *SeekEasy*, an easy-to-use data storage and retrieval system for IBM-PC and compatibles. We dutifully informed you that this sterling product is available only by mail (for $87.00 plus $3.00 shipping and handling) from its manufacturer, Correlation Systems. With characteristic brilliance, we neglected to give you their address, which is:

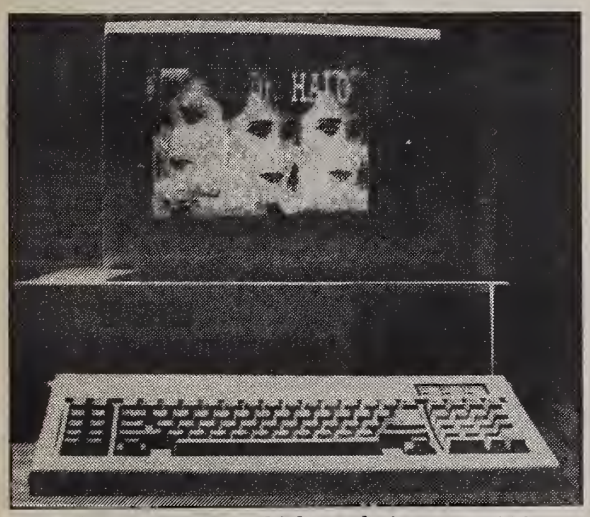
Correlation Systems
81 Rockinghorse Road
Rancho Palos Verdes, CA 90274
(213) 833-3462.

Abject apologies to those who've been inconvenienced by this oversight.

IN RECEIVING

Dr. Halo Halo gives users access to the 640X350 high resolution mode. In this mode graphics can be created in 16 simultaneous colors from a possible selection of 64 colors. IBM's enhanced graphics adapter is now supported by Halo.

Halo, which is a graphics subroutine library, forms the foundation for a number of graphics software packages for the PC market. According



Dr. Halo gives access to high-resolution 640 x 350 graphics on the IBM-PC

to Media Cybernetics, Inc. the Halo device driver for the EGA, which replaces five IBM drivers, requires less storage than any one of the individual IBM drivers. Benchmark tests indicate the Halo driver to be 230% faster than the IBM VDI driver running the same graphic function mix.

For more information contact Pava Wodiska (301) 270-0240; Media Cybernetics 7050 Carroll Avenue, Takoma Park, MD 20912.

VIC-Talker The *VIC-Talker*, from Talktronics, Inc. provides vocabulary translation of text to synthesized speech using advanced English language pronunciation rules and a user-expandable exception memory for Commodore owners.

Special modes are provided to define and select two different "voices," either one usable on a word-by-word basis. *VIC-Talker* will provide sentence-weighted intonation to provide a variable pitch voice to emphasize statements, questions and exclamations.

For more information contact Doug Triman, Talktronics, Inc., 27341 Eastridge Drive, El Toro, California 92630 or call (714) 768-4220.

The Book Of Adventure Games This book is published by Arrays, Inc. All you would-be adventure game players out there who were stopped cold for lack of the next clue can rejoice. The cheat sheet has now been published.

Book of Adventure Games has a few pages of introduction, history of adventures, what makes a good adventure, and how to tackle an adventure game. The book includes descriptions and maps to 75 of the most popular games currently available.

The first thing I did with the book was, of course, jump to one of my favorite games. Their map was accurate. My next step was to go to one of the games I never could solve. What an advantage to have a book full of clues! I don't have time to spend the required amount of time on adventure game to solve the obscure puzzles, so this book

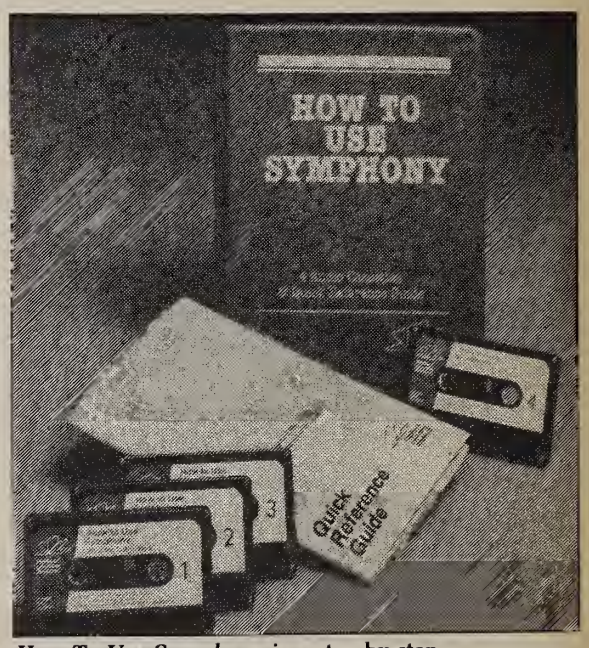
2-Meg Mac

At the Byte Computer Show in Anaheim I talked to Curt Johnson of Levco Enterprises. He was demonstrating their two-Megabyte RAM installation on a 512 Macintosh. Using a RAMDISK program he was able to load four Macintosh programs and still have room for the 800K RAMDISK. All four programs were loaded concurrently and Curt was able to switch back and forth instantly from where he was in each application when it was last accessed. No watch appeared on the screen ever during this demonstration. The cost of this gem is going to be approximately $800 if you have 512K; if not, then closer to $1000.

For more information on the two-Megabyte upgrade contact Curt Johnson at Levco Enterprises, 11568 Sorrento Valley Rd., San Diego, CA 92121 or call (619) 755-7827.

How To Use *Symphony*

FlipTrack Learning Systems is now offering an audio self-study course on *How To Use* Symphony. A step-by-step programmed learning process leads you through all of Symphony's applications, including database management, word processing, printing, graphic and telecommunications.



***How To Use Symphony* is a step-by-step programmed learning system that leads you through all of *Symphony*'s applications**

FlipTrack says the training program provides shortcuts for 1-2-3 and advanced features such as macros and form generation.

For more information contact Judith A. Ressler at (312) 397-4267 or Lee McFadden (800) 222-FLIP.

New Computers From Compaq

The Portable 286 and Desktop 286 are two new computers from Compaq that are even more powerful than the IBM-AT: the Compaq 286 runs 30% faster than the AT and has 20 Megabytes of internal fixed disk drive storage. The system comes with a fixed disk back-up system that protects 10 Megabytes of information on a single, pocket-sized tape cartridge. What a portable (luggable)!

Business Software By Paperback Software

For: *IBM and compatibles*

Price: *Executive Writer* $69.95; *Paperback Writer* $39.95; *Executive Filer* $49.95; *Number Works* $39.95

Reviewed by: *Bennett Falk*

It is no great secret what "personal" computers are doing in the business world. In any given month the top 25 software products will include seven or eight database management programs, five or six word processing programs, at least one spreadsheet program, at least one integrated product, a sprinkling of utilities and "user interface enhancements" and the vertical software of the season (particularly before April 15). These are the software products widely regarded as "serious software," and in keeping with this reputation, the top 25 products have serious prices, serious manuals, and most likely a serious "learning curve."

Now Paperback Software introduces four packages of serious software for the IBM PC and compatible computers that are modestly priced and easy to learn. They promise to be of considerable interest to anyone using a computer for business applications.

Paperback Software's line of business products includes a fully featured word processor (*Executive Writer*), a text data management system (*Executive Filer*), a general purpose spreadsheet program (*Number Works*), and *Paperback Writer*, a basic word processing program. When combined on a single disk, *Executive Filer* and *Executive Writer* may be used together.

These packages have several features in common. All of them have clear, easy to read manuals as well as online help that can be summoned up when needed. They all have good screen management and are "fast" programs, and all of them have a similar feel. This has added benefits for users working with more than one of these packages: what you know about one product will be of help in getting around with the others. In addition, telephone support is available from Paperback Software for all the products.

Executive Writer, destined to be the flagship of this product line, has already been reviewed here (May 1985). It is a very good, fast word processing program.

Executive Filer is no ordinary database product. It is most readily used to manage text, but, in fact, anything that can be put in a file on your computer and displayed on the screen (think of spreadsheets or graphic plots) can be managed by *Executive Filer*. *Filer*'s bias toward "text data management" makes it a promising product for an audience that has been largely ignored by the relational database software of this world: anyone who works with contracts, legal documents, or citations of any kind will find this to be a very helpful tool. In addition, it would serve software developers very well as a basic "source code control" system.

Filer uses concepts already familiar to anyone who has worked in an office: file cabinets, file drawers and note cards provide a simple hierarchy in which to organize things. As in the material office, you must first "unlock" a file cabinet to get at its contents. Once it's unlocked, you may work with any of the cards in that cabinet's file drawers.

The procedure of adding new cards requires only that you choose the "Make Card" selection from the Cardfile Menu. *Executive Filer* will start an editor to allow you to enter the text of the card. If the material you want to file is already on-line, you can insert an operating system file in your file card very easily. Each card you add to a file may be a maximum of 8000 characters (about 1500 words, or five double spaced pages). You may even include special print effects (boldface, underlining, etc.). When the card is edited to your satisfaction, you exit from the editor, saving your work.

As you exit, you will be prompted for the name of a drawer in which the new card is to be stored and for a list of keywords which will be used for retrieval of the file card. A maximum of ten key words may be assigned to any card.

The manual assignment of keywords is a mixed blessing. On one hand, the keyword you assign to a card need not occur in that card. This is convenient if the card's contents are not text, but graphics instructions or spreadsheets. For text retrieval, however, it would be handy if queries could use in-context words you've already entered: entering key words manually leaves you dependent on remembering just what key words are relevant, as well as what key words you have used on other cards with similar topics.

Retrieving cards is easy: choose the "Fetch Card" menu selection and enter a keyword. Any cards you have flagged with that key word will be queued up for display. When scrolling through cards you will see only the first screenful of each card's text, which is a minor inconvenience. To see the entire card, you must select "Edit Card". To its credit, the editor starts instantaneously, but some means of paging through each card without having to start the editor would be helpful.

When querying for cards you will have Boolean operators (AND, OR, NOT) available to build more complex queries.

Executive Filer works very well on its own, but it can also be integrated with *Executive Writer* to provide a very fine writing environment. When used in combination, these two products offer a full-featured "MailPrint" program that allows you to print customized copies of the same document with free variable substitution anywhere in the text. This feature is most commonly used for mailing list management, but you will find that it is suitable for other things as well.

When *Filer* and *Writer* are combined, you can toggle back and forth between the two programs with one command. More to the point, you can move data with ease from document to note card and from note card to document. This will be a godsend to anyone who has "boiler plate" documents to assemble or bibliographic references to be inserted into a document.

Less flashy but no less usable is the *Number Works* spreadsheet package. *Number Works* is disk based: the only limitation on the size of a *Number Works* spreadsheet is the amount of available disk space. Beyond this, *Number Works* includes a timer that automatically saves spreadsheets on disk during a work session. This is a great boon. Everyone knows the value of periodically writing work to disk, but in practice it's difficult to remember to do this.

Spreadsheet features are fairly stable these days. *Number Works* has the ability to show up to eight windows on your spreadsheet. There are forty built-in functions that can be included in formulas. Recalculation may be done either by row or by column. Missing from this package are the ability to "name" cells (a feature which vastly improves the "readability" of formulas), and the

ability to recalculate only a limited area of the spreadsheet. *Number Works* will probably not set the world on fire, but it will do the basic calculating work that most of us are engaged in.

Paperback Writer is the baby of the family. It is a subset of the *Executive Writer* package, with less flexible cursor movement commands and a somewhat different approach to printing. For users who need an inexpensive text editor, it is excellent, but it's hard to imagine that *Executive Writer* will not be a much more attractive product.

The Paperback Software business products are durable office automation tools. Each has been carefully chosen to do a specific job well and economically. The "paperback office" poses an interesting challenge: does software have to be expensive to be taken seriously? Watch the top 25 in the coming months to find out.

Starbridge DOS

Published by: *Starbridge Technologies Corporation*
For: *IBM PC, XT, PCjr, AT; 64K required, 128K recommended*
Reviewed by: *Doug Pencille*

The package cover asks: "Do you feel all alone out there when it's time to run DOS on your PC?" By its very nature, *Starbridge DOS* does take a lot of the guess work out of running DOS because of its menu-driven format. The function keys allow a single key access to the more common DOS applications such as file directory, copy files, rename files, erase files, copy and format disk. Other keypad entries list files to printer or screen, exit to DOS or to an extremely limited HELP screen.

The utilities section of *Starbridge DOS* allows the user to change time and date, set up user menus for direct access to commonly used programs, set up and display user directories, and access the 24 hour/7 day Starbridge Hotline via a communications link. The screen has a section which constantly shows disk drive status, remaining bytes or disk space and a system memory display showing total bytes of memory and free bytes. The lower portion of the screen is used to prompt the user through the setup and access procedures. Hard disk users will find this program more useful than floppy users because of its ability to create root directories and sub-directories for managing the volumes of files usually contained within hard drives.

The documentation package, all eight pages of it, is poorly written and leaves the user to rely on the screen prompts and hopeless HELP screens to initiate tasks. For those who have a modem, additional help is only a long-distance phone call away. With a little trial and error, most of the *Starbridge DOS* applications can be mastered, but it's hard to get very enthused about this program.

SRA Writer

Published by: *SRA Software (Science Research Associates Inc.)*
For: *IBM PC, XT, PCjr; 128K required*
Reviewed by: *Doug Pencille*

SRA Writer is a high-function word processor package for the IBM computer, and not highly recommended for the compatibles. Like most PC software, *SRA Writer* will operate on the compatibles; however, the documentation and printer set-up is customized to support the PC standard printer and the PCjr parallel interface only. This could cause the user to be able to key in a

512K for your Macintosh only $495

Introducing SuperMac's 512™, the Macintosh memory expansion kit that your local computer dealer can install in minutes. That's because the 512 is a genuine Apple board, fully upgraded with only the best quality components. So it's no surprise that it works exactly like Apple's upgrade.

There's more. The 512 is the only expansion kit, including Apple's, to come with a Full Lifetime Warrantee. If a memory chip ever fails, we'll replace it absolutely free. Forever.

Best of all, the 512 costs hundreds less than Apple's upgrade. So if you're looking for a Fat Mac at a thin price, call us for the name of the SuperMac dealer nearest you **(415)964-8884.**

SUPERMAC TECHNOLOGY

1901 Old Middlefield Way, Mountain View, CA 94040, (415) 964-8884

masterpiece, only to find out that the screen is the only place to review it. By now you are probably wondering why SRA would write a package that properly supports only IBM products. This is simply because SRA is a subsidiary of IBM.

The package itself is a smooth operating and well documented word processor. There are no unique functions or keys to remember, and there are no cumbersome stick-on key tabs or overlays to clutter the keyboard. All functions and HELP screens are addressed through a menu at the bottom of the screen. My tour through the various functions proved to be simple and easy to accomplish.

The HELP and error message details are presented in a logical sequence and allow the user to return to the work without the loss of data or reposition of page. The system supports the major word processing requirements such as centering, bold type, underlining, margin and tab set, find and replace (letter, word or phrase), and a full feature cursor movement. Most functions of the package are semi-menu driven. For example, when saving a document, a menu appears, offering options of "save and return to text," "save and erase from memory," and "display disk directory."

During the test run all functions and error handling seemed to work just fine until it came time to save the document. SRA met its downfall here. The system does not account for two drive systems in either a set-up procedure or default drive routine. If, at the time the document name is to be specified, a drive is not called, out the program defaults to drive A. This could crash the main program if the user fails to write protect the boot disk and the document name conflicts with one contained within the main program. If the boot disk is write protected, an error message is displayed; however, there is no way to escape from the procedure. The user must swap disks to drive A and continue on.

Other minor quirks of the package are the autoboot, which allows the bypass of the time and date entry, but also causes files to be saved with no time and date extensions for reference. There is no error handling to protect you from naming a file with the same name as an existing file, thus destroying the previously entered data. The print screen key is disabled and the user must then select one of the print options in order to print the current page for editing purposes.

Still, despite these flaws, SRA *Writer* is still a good working package and deserves a fairly high rating in the word processing software category.

Intuit

Published by: *Noumenon Corp.*
For: *IBM-PC, XT, and compatibles with 256K*
Suggested Retail: *$89.95*
Reviewed by: *Doug Pencille*

Intuit arrived onto the software scene with a high price tag and found itself on the dealer's shelf as a clone of the more popular *Framework* and Lotus *Symphony* programs. Even with an extensive advertising budget, *Intuit* found itself taking a back seat to its counterparts. Noumenon then rethought the matter and re-introduced the product at the unbelievable price of $50.00. Each week the company increased the price to dealers at the rate of $20.00 until sales dropped off. After studying the supply and demand curve Noumenon plotted the price at its current $89.95. Being of a marketing background, I was really impressed by this process, and it would behoove others in the soft-

The Complete Computer Management System

Finally, a system to organize the use of your personal computer and greatly increase your productivity! THE COMPUTER COMPANION replaces loose notes, slips of paper, and memorization with well-organized forms stored in a high quality, three-ring vinyl binder. It puts the miscellaneous items you use with your computer in one place, in one package. Saves much time and aggravation.

1. **Convenient Pockets**
   A place for loose papers, brochures, notes, etc.
2. **Ziplock Pouch**
   Secure storage of warranty cards, contracts, and receipts.
3. **Diskette Storage Pouches**
   Stores up to four diskettes with the appropriate custom command card.
4. **Custom Diskette Labels**
   Preprinted labels to help you sort data
5. **Custom Command Cards**
   Create your own software command cards that tear out and work next to your computer
6. **Weekly Undated Calendar**
   26 weeks of appointments and events.
7. **Records**
   Maintenance Log—A weekly checklist for cleaning and servicing your computer.
   Hardware Data and Report Log—Organizes important information for each of your components.
   Software Data and Support Log—Keeps track of information like support contacts, sales rep data, patches and modifications, updates and support histories, and much more.
   Service Policy Information—Organizes everything you need to know about your service contract.
   Insurance Information—Vital information, neatly organized.
8. **Messages**
   Perfect for phone and electronic mail messages.
9. **Working Tools**
   Flowchart and Display Worksheets—Grid sheets to flow chart your programs and for designing spread sheet models, reports and forms
10. **Usage Log**
    Keeps track of business and personal use of your computer—for tax deductions or corporate budgeting.
11. **File Finder**
    A chronological organizer to help you pinpoint files and clean up cluttered disks
12. **Online Services**
    Online Services—Keeps track of access codes, passwords, protocols, commands, and other important information.
    Database Search Planner—To guide and speed your searches through online databases like CompuServe or The Knowledge Index
    Bulletin Board Systems—Similar to "Online Services"—organizes the vital information for using your favorite electronic bulletin boards.
    User Group Directory—Meeting times and places, library location, important members, and more.
13. **Computer Contacts**
    Computer ID and Phone Book—Keeps track of your contact's name, address, online service ID and/or computer phone number
14. **A-Z Index**
    Organizes alphabetically "Computer Contacts," "On Line Services," "Bulletin Board Systems," "Software Data Sheets," and more.
15. **Beautiful, Durable Vinyl or Hide-style Cover.**
    Available in several colors and styles.
16. **Grid-Flex Hinge** (Patent Pending)
    Guaranteed not to crack.
17. **Quality Double Booster Rings**
    1-1/4" size accepts all standard 5-1/2 x 8-1/2 refills

ware market to give some serious thought to the results in planning their marketing efforts.

Intuit is an integrated software package supporting a word processor, spread sheet, on-screen calculator and a report form generator. Although not as in-depth or versatile as its competitors, *Intuit* does not burden the user with volumes of documentation or require the mass memory to be used efficiently. In fact, with 256K RAM, *Intuit* will outperform its rivals. As for expansion, *Intuit* will soon have add-on applications which include a spelling checker, graphics, communications, and writer's and statistician's kits.

After being introduced to the special characters, terminology, and 20 function key commands used by *Intuit*, the first-time user should find the documentation easy to use and can be up and running within an hour. The package comes with two disks (a boot disk and a root volume disk), less than 200 pages of reference and an illustrated user's guide to explain how *Intuit* works. On-screen help is provided by the HELP key, which will also explain user-encountered errors (those which cause that awful beep when you attempt to do something wrong).

Intuit does not use menus, windows, or mice, all of which tend to clutter the work space and screen. Instead, a meaningful disk-based file directory is used. This allows multi-level directories and direct entry into text, records, forms, and tables. The directories are not limited to DOS file names; in fact, each may be up to 67 characters in length and each directory may contain as many as 4,000 entries. This is, predictably, limited to disk space.

Word processing allows enough versatility to get most any idea from the keyboard to paper. All of the standards are included (bold face, underline, super/subscript, search, replace, insert and delete), as well as a handy user-defined word wrap point. With a little programming, the user is also able to define printer control codes which can be interpreted by keyboard commands to dress up the word processing system.

For a mere 256K RAM requirement, the *Intuit* data base and spreadsheet have exceptional capabilities. The data base accepts as many as 65 fields per record in any combination of alpha-numeric or numeric format. The only drawback of the system I encountered was the two-field sort and slow screen fill when flipping through the records. Spread sheets can be built to a maximum of a 200 × 65 matrix and are not dependent on memory. Any cell, row or column can be identified by either numeric or multi-word coordinates. User-defined macros are definable, in English, by verb usage, to perform custom calculations. In the course of using the spreadsheet I found it more than adequate and very impressive.

As a handy user tool *Intuit* has an on-screen calculator which may be called up at any time without affecting the screen text. It proves to be useful when calculating data for spread sheets and the data base. Unfortunately, the numeric key pad is disabled for the sake of the cursor control, which makes the entry of large volumes of numeric data a cumbersome task.

Customized screen and printer formatting is a simple job with the built-in report forms generator. Any portion of the spread sheet or data base can be formatted on the screen prior to printing. Also, numeric fields can be calculated within a form, and field sorts within forms are allowed.

Intuit supports most all types of printers, both serial and parallel, if the user is able to define his own printer commands. Only three printer types are pre-programmed in the system, and the user is not given much documentation support in the set-up procedure. For those who have information stored in other software program formats, *Intuit* data are transportable.

In the integrated software marketplace, *Intuit* rates right up there with its competitors; it has a few less frills, but a lot more utility.

Electra-Find

Published by: *O'Neill Software*
For: *CP/M, IBM and compatibles*
Suggested Retail: *$50.00*
Reviewed by: *Robert D. Athey, Jr.*

Electra-Find is a multipurpose searching, menu-driven program that can find a word or phrase in any set of files on a disk, and place the found material in a new file. There are CP/M and MS-DOS versions. The item can be searched in the context of line, sentence, word, or paragraph wherein the item lay. The resulting file will show the item searched for, with labels as to the line (paragraph, word, or ...) where found, and the disk file label where found. *Electra-Find* can search any type of file for text, numbers, or strings. It is also set up to search *Wordstar* or *Perfect Writer* files.

I had a specific application for testing *Electra-Find*, using a Kaypro II (1983 version), on a scientific book chapter I wrote last year for the textile industry. I had been considering rewriting portions of the chapter for the paint industry, but looking at five *Perfect Writer* files that come out as 135 pages with 20 additional pages of footnotes/references wasn't my idea of a fun day (or week). The footnotes presented a real problem, because while writing for publication is possible on a dot matrix printer, if you use boldface type throughout the file, references and footnotes are not boldfaced. However, with *Electra-Find*, I was able to create two separate files of the footnotes which could be merged and boldfaced later.

The menu for use of *Electra-Find* is straightforward. There are help commands that can be called up at every step. The documentation is excellent, readable and understandable. You can search any disk drive or user area with *Electra-Find*. (You can search multiple disks with this program, but I did not check this out. It was easier for me to put the 40K *Electra-Find* file on several disks where it might be used to look at the text files.)

To search for references, or footnotes in my case, you respond to the "Search For" prompt by typing the word or phrase to be found. I was looking for the *Perfect Writer* command "&NOTE." Now, the choice method of isolation of the footnotes was as sentences, but specifying an unusual delimiter — the character I use to close the footnotes, the "{". The isolation wasn't perfect, but good enough to use the resulting footnote files as the basis for my revisions. I always got the "{NOTE" and most of the footnote text, but sometimes only part of the footnote. Frequently, I got the text preceding the ampersand, as well. It is possible to do several search types (isolating the word, line or paragraph, as noted earlier), one right after another, to determine which file gives you the best presentation of the information you are looking for, as the *Electra-Find* search is shown on screen in progress. After screening several styles, you can go back and pick the best one. If you use the same search output file name each time, the menu checks to see if you want the file overwritten or not.

These features allowed me to use *Perfect Writer* to edit the text file and the reference file simultaneously to place the footnote numbers only in the text file, copy and move the missing information from the text file to the reference file, and edit the reference file to take out the initially useful information that was not to be printed later, such as the source file name, and the *Perfect Writer* "&NOTE{". This was done, with some editing of text file, and reduction of the reference file, in about six hours for about 75% of the text.

As time goes on, other uses for *Electra-Find* are likely to turn up. The first big use I could think of was indexing the book chapters for the editor, so all the correct keywords would be used. The program was made to order for that application. *Electra-Find* would be worth the modest price just for the broader utility and greater number of options offered than the public domain *REFLIST* program I have seen. (Electra-Find, O'Neill Software, 440 Davis Court, Suite 1822, San Francisco, CA 94111. (415) 398-2255.)

Reviewed by: *Doug Pencille*

You can't judge a software package by its cover any more. I must have passed up *Nutshell* at the software store a dozen times just because the package has no more than the name, a picture of a nut shell and a statement "ALL YE NEED TO KNOW." There is no product description, no over-stated advertising slogan or lists of features. Inside, however, is a neatly packaged documentation book broken down into three main topics. The first is the essentials, giving an explanation of Information Management Technology and basic terminology used in data base management and how they apply to the program. Equipment and installation procedures are established in a logical manner so that even a beginner can start-up error free, yet not oversimplified for the experienced user. A hands-on type instruction disk is supplied to acquaint the user with the step-by-step practices necessary to create and work with files. This section of documentation also explains the keyboard and its special keys and how to properly enter and exit the program.

The next section is a detailed reference to the screens and options of *Nutshell*. A system map is provided in a hierarchy block diagram format which can become very useful when exercising the more complicated functions of the program. Nearly all screens and options of *Nutshell* have screen messages and/or prompts to guide the user through the procedure. An extensive HELP key is provided, and error handling is usually followed by screen messages which will guide the user either through or out of the task. If this is not enough, a toll free HELP HOTLINE telephone number is provided as part of the license agreement. Each and every item in the reference section is well documented and supported by either examples or mock screen displays. A great deal of professionalism has been exhibited by Leading Edge Software in the presentation of this section of the manual.

The third section of documentation is the appendix which provides ASCII conversions to and from other files, a glossary of terms used within the documentation and finally the index. If all of

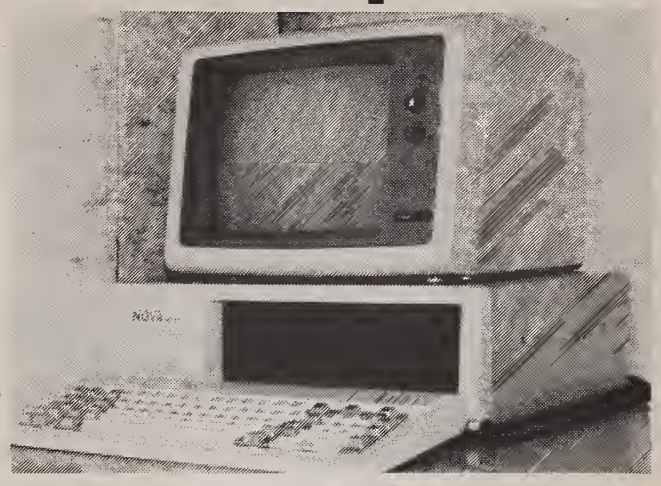
NOVA PC/XT/AT-Top Of The Line
IBM Compatible Computer

Features:
- Affordable priced **PC/XT/AT** computer
- Runs PC, MS-DOS, CPM/86
- Of Course, this versatile computer runs Flight simulator, Lotus 1-2-3, Symphony, Framework, Peachtree, D Base II & III, PC Paint, Auto C.A.D., . . . and tons of software.
- We have a demo system available for your testing.
- OEM, dealer inquiry welcome



NOVA/AT IS AVAILABLE NOW

Computer System

NOVA PC Bare Bone $695
Includes: 64K mother board, case, 130W power supply, keyboard, floppy controller card

NOVA PC 256K $1295
Includes: keyboard, 130W power supply, 2½ ht. dr., 6 pack compatible multifunction board, color graphic card, 4-drive controller card

NOVA XT 256K $1895.00
Includes: keyboard, 130W power supply, 2½ ht. dr., 6 pack compatible multifunction card, color graphic card, 4-drive controller, 10MB hard disk, DTC hard disk controller

NOVA AT Entry Model $2995.00
Includes: NOVA AT 256K mother board, Intel #80286 CPU (option 1MB)
(Option: IBM) 195 W power supply,
1.2MB floppy drive, hard disk/floppy controller

NOVA AT Enhance Model $3995.00
Includes: NOVA AT 1MB mother board, Intel #80286 CPU (Option 1MB), 1.2MB floppy drive, 20MB hard disk, 2 Serial/1 parallel card, 195W power supply, keyboard.

Upgrade Kit for PC to XT

Internal, Miniscribe 10MB H.D. + DTC controller	$625
Internal, Miniscribe 20MB H.D. + DTC controller	$795
Internal, Irwin 10MB tape back-up with cartridge and cable, free installation	$625
High quality XT 130W power supply	$130
NOVA external, 20MB hard disk drive	$995
NOVA external, 10MB tape back-up system	$850
NOVA external case for hard disk and tape back-up drive with 50W power supply/fan	$175

Disk Drive and Monitor and Accessories

Teac 55B½ ht. 360KB floppy drive	$105
Microscience 10MB, 20MB	lowest price
Miniscribe or Teac 10MB ½ ht hard disk	$420
Keytronics compatible #5151 keyboard	$130
Hitec keyboard	$130
Amdek 310A (amber monitor)	$147
Amdek color IV (720X240) color monitor	$385

Nova Series Add On Board

NOVA mother board w/installation manual	$79
NOVA 6 function board w/64K (Ast 6 pack compatible)	$185
Mono-graphic board (hercules compatible)	$170
Color-graphic board w/printer & game port	$150
Floppy controller w/cable.	$90

***Nutshell* is an easy-to-use, well-documented program for data base management**

this sounds like too much reading, you will be surprised to know that all of this written support is contained in only 252 pages, including the pictures.

Nutshell runs as nicely as it reads. I transported some files from another program and worked them into the *Nutshell* format. Fields and record formats can be easily manipulated to fit the screen and most any print layout desired. Information can be calculated by using previously defined formulas and field names, or a summary field can be maintained to provide a total, average, or a count of the number of records which contain a value within a specific field.

The sort and find functions of *Nutshell* are very powerful. The program maintains the records in the order they are entered. As sorts are made, either numerical or alphabetical in ascending or descending order, you can view or print them in an arrangement that is different from that of entry.

Nutshell has a layout option which enables the user to define the way in which the records are displayed on the screen and sent to the printer. Multiple layouts are allowed and saved in the file to provide a variation of output for the same set of records. Customized formats can be created using all or part of the total information contained within a record, *Nutshell* can also reshape any field, highlight it, or partition it into sections. Other options within the program allow you to create new fields, rename existing fields, delete fields, and reformulate the calculation and summary fields.

Peripheral items include the keyboard overlay, which is short and simple, with the inclusion of being able to use the NUM LOCK key to speed up the entry of numeric data. To speed the user though the screens and in and out of fields, *Nutshell* has combined the use of the CTRL and ALT keys with other special keys. Instead of, for example, returning to the menu, then selecting the find option, the user can go directly by selecting the ALT and F (Find) keys. A safety feature of autosave and a timed auto-backup are written into the program.

Nutshell was a delight to work with, from its presentation of documentation to the smooth operation of the program itself. Just look for the plain wrap cover, the software will take care of the rest.

WHAT'S NEW WITH THE MACINTOSH FINDER, MACWRITE & MACPAINT

By Barbara Leone

Macintosh users who have not yet acquired the new Finder, *MacWrite* and *MacPaint* are in for some pleasant surprises.

First, this Finder (version #4.1) has a Shut Down option in the Special Menu. This option allows the user to eject both disks at once without the trouble of selecting them first. With the old Finder it was possible only to move, duplicate, rename, or discard documents, folders, and applications with the **by icon** view displayed on your directory window. With the new Finder however, any of your desktop work can be done whether you have selected, from the View menu, **by icon, by name, by date, by size** or **by kind.**

Another handy addition is that of the padlock displayed with a locked document. If a folder or a disk has been locked a padlock will appear in the top left corner just below the title bar.

With the old Finder, it was not possible to drag an icon from an open window to the shadow of another open icon. This has been changed with the new version. As before, if you drag an icon to the open window of your disk you can place it anywhere you wish; if you drag the icon to the shadow icon the Finder will place it in the next available location.

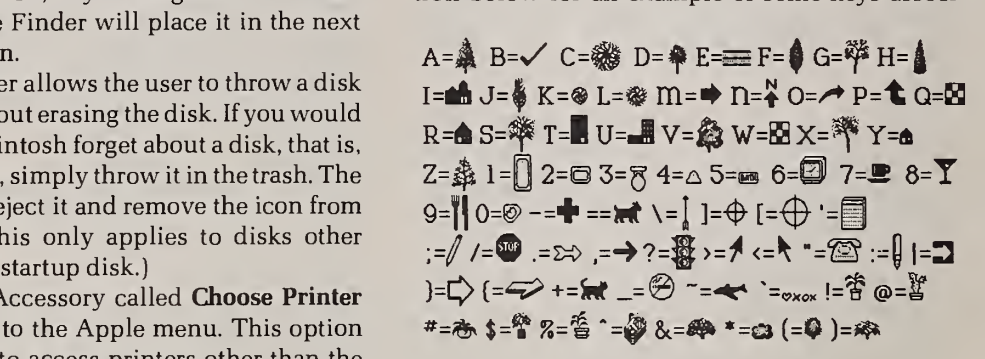
The new Finder allows the user to throw a disk in the trash without erasing the disk. If you would like to have Macintosh forget about a disk, that is, stop asking for it, simply throw it in the trash. The Macintosh will eject it and remove the icon from the desktop. (This only applies to disks other than the current startup disk.)

A new Desk Accessory called **Choose Printer** has been added to the Apple menu. This option allows the user to access printers other than the Imagewriter. If you are using a LaserWriter, for example, after the installation it will appear as an option in the Choose Printer dialog box, allowing the user to access this printer. The Macintosh is preset to work with the Imagewriter. However, you will use the Choose Printer option only if you connect AppleTalk or another piece of hardware to the printer port and want to designate the modem port for the Imagewriter.

Most Macintosh users have heard about the Switcher, a new program that allows the user to move from one application or document window to another quickly and painlessly. The new Finder includes an option in the Special menu that in no way replaces the elegance and appeal of the Switcher, but does add extended flexibility to the Finder. This option in the Special Menu is called the **MiniFinder.** With the MiniFinder it is possible to select up to a total of twelve mixed or matched documents and applications. The documents and/or applications you select for the MiniFinder must be on the same disk, although it is possible to move between disks with the MiniFinder. Once the MiniFinder is installed on your disk, whenever you start from this disk the MiniFinder window will appear on your DeskTop. Once it's installed, you can remove the MiniFinder by pressing the Finder button in the MiniFinder window and throwing the MiniFinder icon in the Trash, or by selecting **Use MiniFinder** and clicking on Remove. All of the housekeeping involved in using or discarding the MiniFinder detracts from its usefulness.

Probably the most appreciated addition to the new Finder is the **ShutDown** command. Found in the Special menu, this command eliminates the necessity for selecting your disks to be ejected and restarts the Macintosh by either turning the power off or placing a new startup disk in the disk drive. Probably one of the most aggravating features of the old Finder, in addition to the overall reduced speed, was waiting for disks to be ejected from the drives. Thank you, Apple, this one really shows you care.

A new font called Taliesen has been added to the Update disk. This is a pictorial font with a lot of cute little pictures that can be used in your documents in various ways: to make custom stationery, for example, or to be moved into *MacPaint* and enlarged or changed. See the illustration below for an example of some keys associated with the pictures to be found within the Taliesin font. When experimenting with these, watch what happens using the same keys with the Caps Lock key in lower case. The new Font Mover has a new option to allow not only copying and removal of fonts among disks, but desk accessories as well.

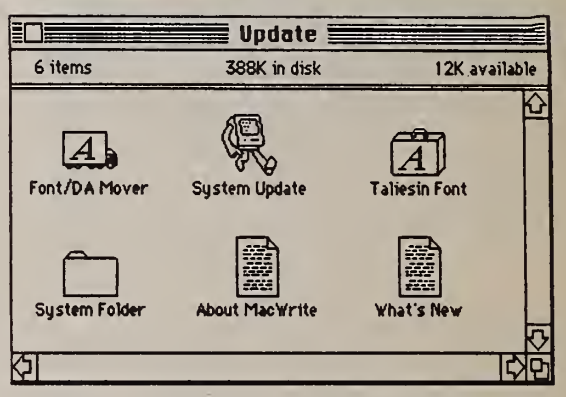


To update all of your disks to the new Finder, the update disk has a helpful utility. The system update icon, which looks like a walking Macintosh (see illustration), can be opened as with any application and will step you through the process. It installs the new Finder, the Choose Printer desk accessory, the System file, and replaces any Imagewriter file. Your scrapbook files will remain intact.

If you are using *Hayden Speller*, be careful. If you have not received an update from the manufacturer, the program will not work with your new *MacWrite* files. This is the only program that I found a problem with, but there may be others.

A word of warning: if you like all of those old fonts you may have collected with the old Finder, hang on to them on a separate disk and use Font Mover to add them to your applications. For more information about the Finder & Font Mover, the What's New icon on the System Update disk will describe the changes. What's New can be printed with *MacWrite*.

Apple tells me that no noticeable changes have been added to *MacPaint*. The changes that have been made were mostly bug fixes.



The new *MacWrite* is called *Disk-based MacWrite*. With this version, the increased speed is based on continual access of the disk as opposed to the internal memory. The scrolling of documents is much faster. If you only have one disk drive, it is recommended that you keep both the application and the document you are working on together on the same disk; otherwise, you will spend a lot of time swapping disks.

All documents created in the old version of *MacWrite* will be automatically converted to the new version when attempting to open them. Macintosh will display a message asking if you wish to convert your document. Clicking the mouse on the OK button will begin the conversion. The document will come into view as untitled where previously it had a name. If the original name is given to the saved document, it will no longer work with the old *MacWrite*. If you want to keep the original version to use with the old *MacWrite*, give the converted document a new name. Drag the document to a different disk for use with the old *MacWrite*. Once converted for the new *MacWrite* a document cannot be changed back to the old format.

The new spacing command **6 lines/inch** is standard typewriter single spacing. Some font setting will look chopped off with this option or with subscripts and superscripts. One way to avoid this chopping effect is to experiment with printing. Another way is to insert a ruler and turn off the 6 lines/inch setting where applicable.

To check the size of your documents the Apple menu has an **About MacWrite** option which will constantly give the user an update as to the size of a document being created. The update disk has a file, also called **About MacWrite,** which gives more information about these and other *MacWrite* enhancements; it can be printed and saved for future reference.

Apple is offering these updates free to Macintosh owners. Visit your local dealer, preferably the one where you bought your Macintosh, and they will supply you with the update. □

THE CRACKER SPEAKS

Confessions Of A Computer Criminal

By Don Hamilton and Mike Markowitz

In October, 1983, Bill Landreth, a.k.a. The Cracker, was arrested at his home in Poway, California by the FBI. The Feds took exception to the then-17-year-old Landreth's pastime of illegally accessing GTE's Telenet system and sending messages to his hacker buddies across the country.

Landreth is now the author of a Microsoft Press book, *Out Of The Inner Circle* (reviewed this issue), in which he relates how he got started in the life of "crime," explains hackers and the hacker ethic to the outside world, and suggests measures you can take to keep your system free of intruders.

Last fall Landreth spoke at length to *MicroTimes'* Don Hamilton and Mike Markowitz on the subject of his adventures. For those of you who missed it last November, we've reprinted selected portions of the interview.

Why don't you give us a little background?

Well, I'm Bill Landreth. On October 13, 1983 I was served with a search warrant by the FBI. They came in and took all of my equipment, which at that time was mainly that Franklin there. They told me that I was being investigated for wire fraud, that I was suspected of being involved in illegal activity using the GTE Telenet computer.

Did they kick down your door?

No, but I'm told that they would have if we hadn't opened it for them — there have been incidents where the mothers of people involved didn't open the door...

Friends of yours?

Yes. One case in Detroit, the person's mother didn't want to open the door and the FBI just broke in the door. I know of another case in your area (Orange County) where they climbed in through a window — they didn't even come to the front door — they just climbed up a water drain pipe and broke in a window — I guess under the pretext that they didn't want to give the hackers a chance to erase anything by knocking on the front door.

How did you find out about the system, by just studying and getting into it?

Well, I had a little help. First, I was given an account, basically like the one you saw, pretty much a public account. Then, through just playing around with the computer, I was able to get one other account.

What kind of account did you create?

On Telemail there are really two kinds of accounts: administrative and user accounts. Telenet gives an administrative account to a company and the company uses it to create other accounts for their users. I just got hold of one of these administrative accounts, and the crime was creating a message system by creating other accounts for friends.

So that's how they were losing, by having these other accounts.

Yes. People all over the country would log on and leave mail. I think we all knew and made it quite clear that Telenet was well able to know that we were communicating and able to read the messages we sent; but like I said, I didn't think we were offending anyone that much, because we're not used to the owners of computers reacting that heavily against us.

What is your field of expertise?

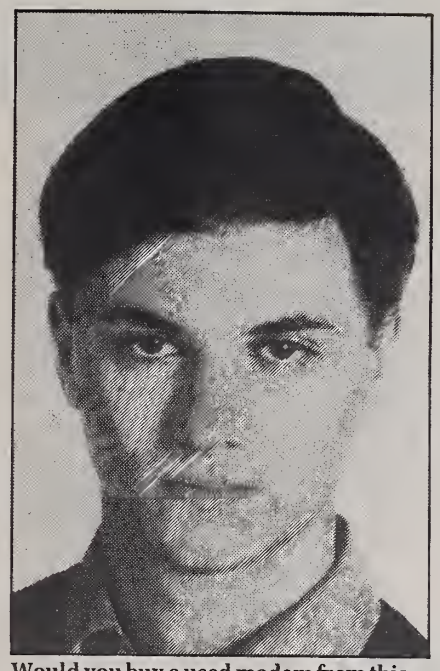
People come to me with problems on VAX's — that was my first computer. Also psychology questions like, "I've got this person...I've got this data on him...What do you think he might have for a password?" I'm better than the average person at figuring out what to try. And I'm more willing to talk to new hackers, so I get a lot of them asking me for advice. I try not to be as elitist as some people.

How did you get VAX training?

By being on one illegally. I've never seen a user's manual, but they've got extensive help files...and then after years of being on computers, you find out the common commands, it's not all that difficult. On Telemail, for example, part of the crime involved creating other accounts. Just by knowing how computers operate, I was able to figure out how to create accounts. They try to make things pretty simple to remember once you learn them. It's not that difficult. That's not where the security is.

Are there some passwords that you run into a lot?

There are three that you find all the time, not necessarily in this order. SECRET, LOVE and SEX. No one ever seems to claim that they've had this password, but you run into it a lot. Also, the single most commonly used password is the person's first name or some variation of it. Along the same line, one of the versions of Hack, Hack (which is trying all permutations) is getting a database which has anywhere from ten



Would you buy a used modem from this man?

to fifty things that you want to try and then plugging in fifty account names and letting the computer try them out. You'd be surprised at how many computers you run into. Anywhere from one in fifty to one in two hundred numbers is a computer — but for a computer dialing, two hundred numbers is only a half hour. It's not that much trouble. There are thousands of computers, and they're throwing themselves at you, you don't have to go searching...

A lot of people worry about computers being addictive. What's your sense of that?

Hard to say. I've been into computers since about 1979, when I was about fourteen. I didn't know anything about computers. I knew that video games were controlled by computers and that's about it. I tried, I'm sure, all the dumb things, to get the computer to do something and found that they didn't work. Within a few months I was writing simple programs, and that's what pulled me in.

Would you say that your knowledge of computers, if you started at fourteen, has helped you with your school work?

It probably would have helped if I'd used it constructively, but I didn't. I neglected school mostly...I was very bored with it.

So school was sort of irrelevant?

Yes. It was to me, because I could learn this stuff at my own pace. I could learn what I considered to be much more important.

What kind of grades did you get?

While I was in one school I still maintained between a B and a C average, but we did move around a lot. I went to three different high schools.

What would you say to a person about to start on the same path you did? Is it a good thing to do — to go out and dodge the FBI?

Well, one thing about hackers that a lot of people don't understand is that being on a large corporate computer is an everyday thing, and the system operators are usually our allies; it's not like they're after us. They're not system operators because it's such a great profession, but because they like computers, and they very likely were hackers before they became system operators.

Was the movie *War Games* a factor in your arrest?

I think there's not much question of it. After the movie *War Games* came out, some people said it informed the FBI, but I assume the FBI knew the state of things without the movie. But it did cause public outcry. "This really is powerful, and these kids really do all this..." They had to put up a show of force.

A second thing, which also may have contributed, is that all these new people with Commodores or whatever wanted to become hackers and they made no secret of it. All of a sudden, where there had been maybe hundreds in the country, there were now thousands. It caused something that's unfortunate, which is an elitism among the people who were around before, which I don't like.

So you think that it is quite a bit of fun, and not that bad if you're careful not to do anything illegal?

For people just starting, I would definitely say, I spent a year at least learning about computers before I even knew about telecommunications.

So that you don't accidentally do something illegal?

Yes. In fact, that's what the 414's (in Wisconsin) did. They decided they wanted to cover their tracks and delete the log files, and they deleted something totally different and caused a lot of trouble.

Inexperienced hackers leave trails all over...

Yes, and don't take precautions...

What kind of precautions?

It depends; very simple things, like not leaving your name, or not using your real name, or the answerback on your computer. There may be some way they can find out the serial number of the program you're using, and track you through that. Just dialing direct can be dangerous if you're worried about being traced. Advanced hackers might pick up the phone and talk a few seconds before they connect to the computer because the phone company doesn't want to touch trying to trace a voice call, because of the legal problems involved, while they might want to trace a data call. □

Service And Repair

Who You Gonna Call?

By Mary Eisenhart

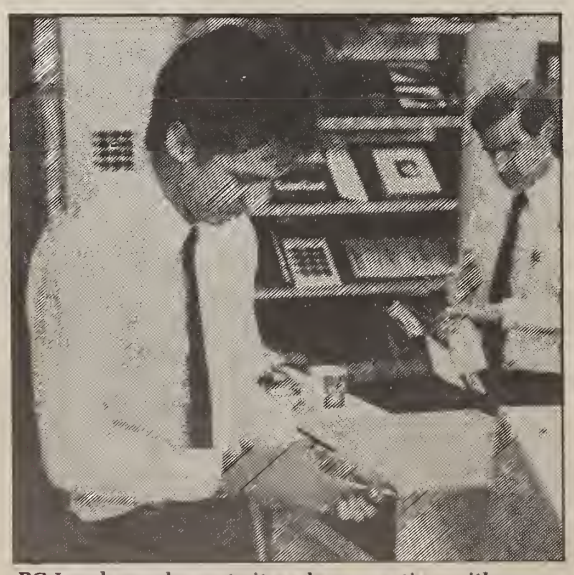
Into each life some rain must fall, but lately too much has fallen on yours. You just terminated your terminal with that cup of coffee you *knew* shouldn't be on your desk. Your floppy disk drive just flopped. You're in the middle of an urgent project and your whole system just died for reasons unknown. Your 256K machine needs 1 megabyte. Your boss just fell for the blandishments of some smooth-talking devil who sold him 50 new computers for the office, without bothering to inform him that all the company's software would have to be converted to the new operating system. Now what?

As the computer plays an ever-increasing role in business, education and home management, keeping it running smoothly becomes a matter of ever-increasing importance. Consequently, a host of businesses are springing up to satisfy the needs of users with a large array of repair services, maintenance contracts, upgrades, loaners, and disk duplication. No matter how esoteric your problem, there's probably somebody out there who can deal with it; how do you go about finding them?

If your machine is still under warranty, its manufacturer has probably spelled out pretty clearly what procedures you should follow. If not, your dealer may be able to steer you to the nearest factory-authorized repair service; he may operate one himself. Word of mouth is also a good information source — check with other members of your user group for their recommendations (or dire warnings).

Although it's not always possible to anticipate every catastrophe, it's a good idea to explore your service and repair options *before* you need them; that way, you're likelier to be able to make informed and cost-effective choices.

Many dealers offer a variety of services on equipment they sell, and the people who sold you your system may be your best repair bet. Some maintain their own repair operation, others subcontract the operation to companies that specialize in particular types of computer work; in either case, the dealer's reputation is strongly linked to the quality of service you get, which is a powerful incentive to do well.



PC Land supplements its sales operation with comprehensive service and repair

Mark Bertram of PC Land, which has two branches in Southern California, admits that he's primarily in the computer sales business ("I'm the cheapest in the city," he maintains, "and I give a 30-day exchange on anything you buy from me"), but supports his retail operation with complete service and repairs performed by the G & W company; G & W can provide a 24-hour turnaround time on repairs, and will pick up the malfunctioning equipment at the customer's home or business if necessary. PC Land backs the work with a 90-day parts and labor warranty, and will provide service contracts if desired.

Other dealers and value-added resellers offer service agreements as part of their sales packages. James Cross, Chairman and CEO of Service World in San Francisco, points out that "Everything we sell to the end user comes with a one-year service contract." Other repairs are also performed and billed according to time and materials used; Service World backs these repairs with a 90 day parts-and-labor warranty. On-site computer maintenance is an integral part of Service World's operation — Cross observes with a certain pride that a survey by *PC* magazine found Service World's 1 hour average response time the quickest in the Bay Area, and notes that on-site maintenance comprises 95% of Service World's repair work.

PHOTO: PAT JOHNSON STUDIOS

Service manager Carmen Lahma and technician Gus Bamberger of Service World provide skilled repair and maintenance for your PC

Consider also the fact that down time may be costing you a good deal of money, and check out not only a company's response time but its policies with regard to loaner equipment. Many, including Service World, offer loaners if the repair is likely to be time-consuming; if this is a crucial factor to you, ask.

Also, while a business's hours might not seem like a very important thing to think about, a sick computer doesn't care what time it is, and it's very helpful to know in advance who's available outside of normal business hours. Ann Chamberlain of the Electronic Depot in Fremont, which is open 10 am to 8 pm weekdays and 10 to 5 on Saturdays, says "I probably take in 50% of our repair work after 5 pm." Another potentially important factor in your decision is *where* the repairs take place; while many places offer on-site service calls, not everybody does. If carrying your ailing equipment to a service depot or shipping it off to be repaired would present serious problems, find out who makes house calls.

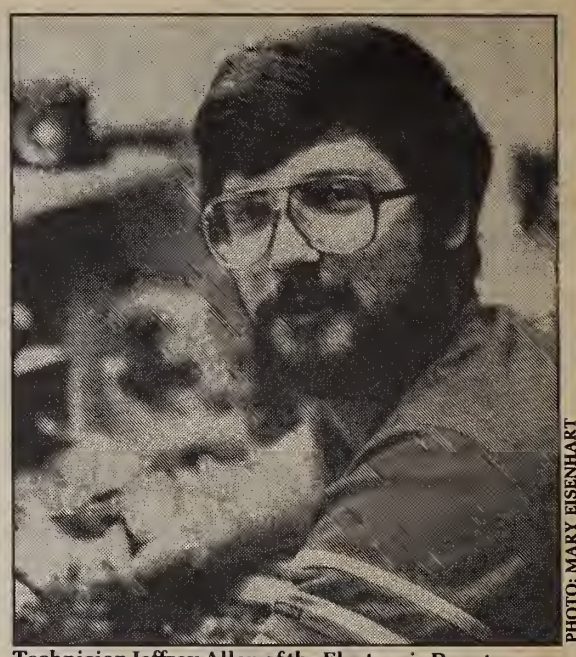


PHOTO: MARY EISENHART

Technician Jeffrey Allen of the Electronic Depot pursues an elusive short

If your computer is a popular brand like IBM or Apple, you're not likely to have much trouble finding somebody to take care of it. If, on the other hand, you have a relatively rare or orphan machine, life may be a bit more difficult. Mike Kneeland of Mission Peak Systems, which is a factory-authorized repair facility for Kaypro and IBM as well as Osbornes, notes that the temporary demise of Osborne Computer left a lot of users feeling stranded and created a support vacuum which the dealers had to fill. As a result, a national network of Osborne dealers was formed. "We support a network of 450 dealers in the country," says Kneeland. "Our main business is an exchange on parts and support. That gives an Osborne owner the ability to live in Iowa and still have an Osborne." An Osborne owner anywhere in the country can call Mission Peak for a referral to the nearest dealer. If you have a fairly unusual machine, or if its manufacturer has vanished off the face of the earth, your user group may also be a valuable source of information.

As systems become increasingly complex, it's not uncommon for users to configure their own systems, using components from a variety of manufacturers and bought from different establishments. When something goes wrong, they often find that Dealer A is willing to look at the disk drive he sold them, but won't touch the terminal bought from Dealer B or the monitor from Dealer C. As a result, service companies came into existence that do no sales at all but specialize in maintaining whatever array of components the user owns. Carl Alvarez of Computer Doctor of San Francisco says, "We are service only. We don't sell. We try to assure folks that our motive is to fix their machine." Such establishments often offer maintenance agreements that can be tailored to the individual customer's needs. Says Jim Milligan, President of Serviceland of Northern California, "Our service policy is not cast in concrete. We don't say, 'Here's the menu, take what you want.' We want to work with the individual customer to work out a program that's good for him and good for Serviceland."

In choosing your best service option, a key element is the amount of work your system is likely to need. If it's simple, lightly used and fairly

PHOTO: MARY EISENHART

Technician Rick Maria of Serviceland performs an intricate repair as president Jim Milligan looks on

hassle-free, your best choice may be paying for occasional maintenance and repair on an hourly-rate-plus-parts basis, which nearly everyone offers. If your system is complex, delicate, or frequently used by careless employees, you might want to consider a long-term maintenance contract.

Find out as much as possible about *how* a company does its repairs, since this will have an effect on your ultimate cost. At Serviceland, for instance, Milligan points out that a customer with a maintenance contract is primarily interested in speedy relief, so many problems are solved by a simple on-site board swap or other replacement of an ailing module. The customer who's paying for repairs on a parts-and-labor basis might find this excessively expensive if the actual problem is with a minor part, so it's more effective to diagnose and repair the specific difficulty. Ann Chamberlain of the Electronic Depot says, "We troubleshoot down to components, which is most effective for the customer. It may be more costly in labor, but in the long run it's more effective."

You'll also find businesses specializing in a particular service: disk duplication, media conversions, or VCR repair, for example. Often specialization pays off in terms of expertise. Trans Data Corp of Belmont, for instance, concentrates on servicing disk drives and related components; Al Glickman of Trans Data points out "We originated the reconditioning of disk heads nine years ago, and we're an approved vendor to most OEMs and systems houses."

Whatever your service and repair needs, a little preliminary research can save a lot of time, money and aggravation. Check around. Compare warranties. Consider special features a particular business may offer. Ask other users of your machine type who's done good work for them. The following chart may suggest some ideas .

SOUTHERN CALIFORNIA

Name Of Business	Type of Work Done	Machines Serviced	Warranty	Service Options	Comments
Computer Maintenance 8223 Remmet Canoga Park, CA 91304 (800) 848-6700	Service and repair; upgrades, board installations	Micros, minis, mainframes; factory authorized for Mannesman-Talley, C. Itoh, Data South, Liberty Electronics, Teleray, Alpha Micro, OSM	90 days parts and labor	Carry-in, mail-in, field service and free pickup and delivery in Southern California, service contracts	Services dealers nationwide; programs and discounts available to dealers
Computers and Peripheral Repair 8957 Reseda Blvd. Northridge, CA (818) 349-1033	Repairs, some upgrades, hard disk installation	Factory authorized for Epson, Juki, Panasonic, Diablo, Okidata, Comrex, Daisywriter, NEC, Molecular. Also services IBM, Franklin, Apple, TRS, Kaypro, Televideo	30 days parts and labor	Carry-in, on-site repairs from Long Beach to Ventura, service contracts	Rentals, loaner equipment in case of lengthy repairs, same-day service available for extra charge
H & W Disk Drives 1101 E. Pacific Ave. Anaheim, CA 92805 (714) 526-1992	Repair floppy disk drives	Most 5¼" and 8" models	90 days parts and labor	Carry-in, mail or UPS shipment	All personnel have long experience in disk drive field
PC Land 2400 Barrington Los Angeles, CA (213) 478-7709 1200 Pacific Coast Hwy. Hermosa Beach, CA (213) 374-1223	Sales and service; repairs, upgrades	Any	90 days parts and labor	Carry-in, service contracts	24 hour turnaround time on carry-in repairs; pickup available
Quantech Electronic Services 610 S. Harvard Blvd. Los Angeles, CA 90005 (213) 383-0941	Service on home computers, VCRs, TVs, projection TVs	Atari, Coleco, Mattel, NEC; approximately 40 makes of video equipment	30 days labor 90 days parts	Carry-in, in-home repair, service contracts	10 SoCal locations; service provider for many retailers; extended warranty plan to continue maintenance coverage after mfrs. warranty expires
Serviceland 18348 Ventura Blvd. Tarzana, CA 91316 (818) 881-1180	Service, repairs, upgrades, hard disk installation	IBM, Display writers, Compaq, Corona, most other IBM compatibles, Apple, AT&T, most printers, monitors, disk drives	30 days parts and labor	Carry-in, on-site, service contracts	Services both large corporations and home users; usually 4-hour turnaround time on repairs
Text Sciences 2716 Ocean Park Blvd. Santa Monica, CA 90405 (213) 452-9114	Media conversion, text compression	Tape to disk, disk to disk, micros, mag cards, optical scanner, 200 disk formats	100% warranty on all work	Work done on premises	Trial disk available to test converted data on customer's equipment, free with orders of 10 disks or more, $25 otherwise. Low cost duplication and conversion

The NetWorkers

Information Systems And Services For A Changing World

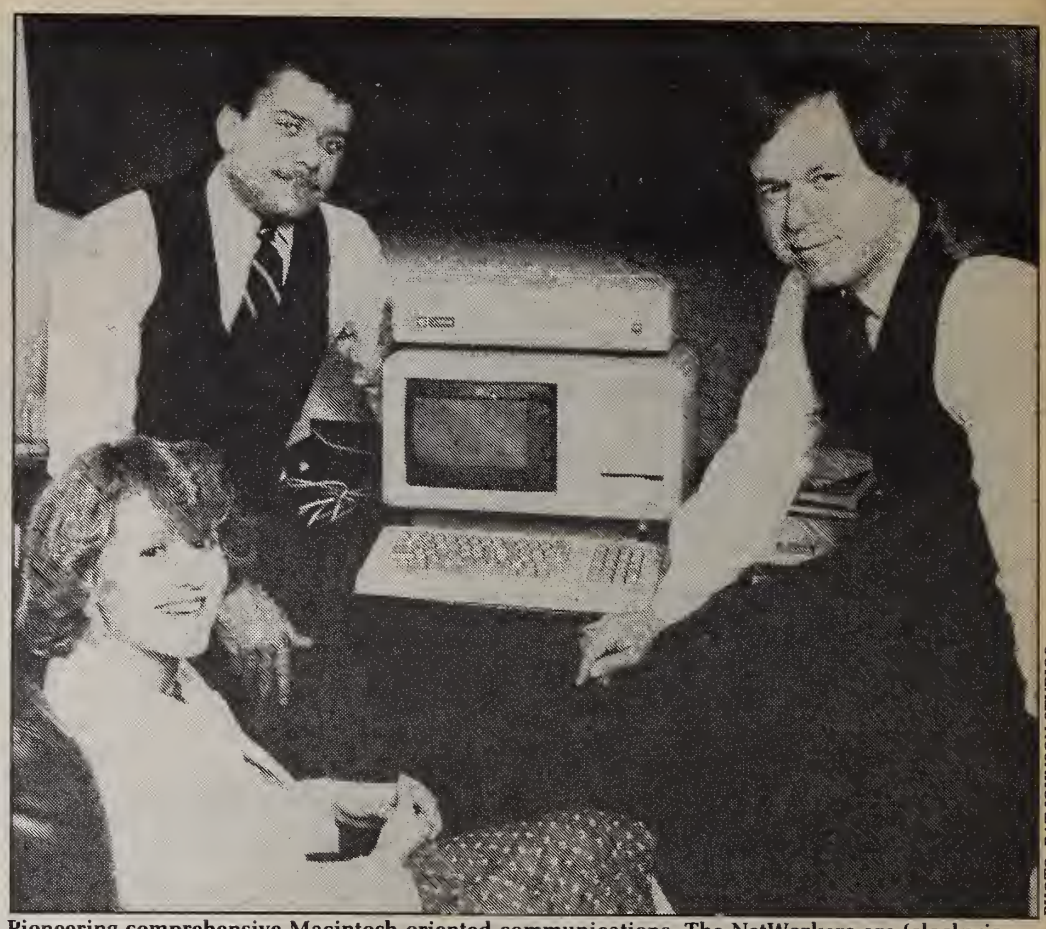

PHOTO: PAT JOHNSON STUDIOS

Pioneering comprehensive Macintosh-oriented communications, The NetWorkers are (clockwise from left): Roxane M. Schwabe, vice president of operations; Lewis Guice, founder and president; Lisa, orphan computer; John Zimmerman, vice president of finance

By Ken Goehner

On-line services are beginning to emerge from their infancy. In 1970, the first computer-conferencing system was initiated. It was a large, unwieldy affair with bugs and bombs enough to afflict a wide range of mainframes around the country. Use was limited to a small number of scientists, industries, and the government (especially the military). In 1975 the ALTAIR computer was released, an event generally regarded as the start of the Micro revolution. 1977 brought the introduction of the Apple II and the TRS-80. Things got progressively more complex after that. PCs, clones, HPs, Ataris, Commodores, etcetera were introduced to the home market, and in 1984 Apple brought forth the Macintosh.

Modems made it possible for these machines to communicate with mainframes and other micros. With the widespread proliferation of personal computers around the planet, people have been developing new and exciting ways to communicate with each other. BBSs (Bulletin Board Services), LANs (Local Area Networks), news retrieval services, tele-conferencing systems, and a number of variations on these themes are becoming an integral part of the work and home environment. As we move more and more towards an information-based economy, understanding these systems, their applications, and their potential, becomes more important.

These new techniques afford numerous opportunities for the new age entrepreneur. One of the best examples of a totally integrated resource industry is an outfit called The NetWorkers. This company is totally dedicated to support and services for the Apple Macintosh, XL, and Lisa user. They feature an on-line consulting service, on-site consulting (backed by Organizational Software and Intersol), on-site maintenance and referrals to cover other machines, on-line graphics services, product reviews, an on-line ordering service that covers all Macintosh products (delivery within 72 hours at 20 to 30% off list price), customized software (they specialize in business software and are authorities on Omnis products), an electronic mailbox, a tele-conferencing capability, and a Macintosh oriented news service. These services "reside" in a host computer maintained by the Infomedia Corporation of San Bruno, California and run on a format called Notepad, a system generally regarded as one of the most user friendly and secure in the country. The system can be accessed through either Tymnet or Telenet and is available 24 hours a day.

"We started off wanting to put together a consulting firm that was tied together by a network," explains Lewis Guice, president and co-founder of The NetWorkers. "The idea was to have a number of consultants linked together and distribute work that way — by receiving jobs in a central area and then assigning the work around and handling the invoicing and billing. Then I was taking some training down in San Cruz Operations with Kearney Rietmann (now the editor of *Macworld*) and that crowd — I was working for the Computer Connection at the time — and we got to talking about teleconferencing. They asked if we had an on-line service and I said no, but I could create one. And I did.

"The initial idea of MacNet/News was to provide on-line support and on-line consulting as an information utility. It has since grown to handle public domain software and error codes; we'll be selling software over the network, and we have other plans, other directions.

"The essential idea of what we're doing here at The NetWorkers," says Lewis, "is that we're building a giant brain — we're turning the world into one huge multinational economy, a political sphere, and in order to do that we've got to connect everybody. It's taken innovative companies like Apple to set up nerve points or nodes, and it's going to take innovators like The NetWorkers to connect these centers of information and start creating this exchange of knowledge. That's our concept. Now we have to take that concept and make it practical. So we've taken a machine that we believe in — the Macintosh — and a service that's very practical, and apply them. But the underlying principle remains the most important element — we're doing this to finance the next step, which is real-time grassroots global communications and the creation of a true Earth consciousness." □

The NetWorkers Announce An Open On-Line Discussion Of The LISA 7/7 And The Macintosh XL

There are at least 50,000 Lisas and XLs in use around the world. By discontinuing this product line, Apple has left a lot of high-powered orphan machines around the planet. While Apple has promised support for these machines for the next five years, it is obvious that third-party software developers will be looking to greener pastures and that Lisa and XL will go the way of the dinosaur. According to some industry analysts, this may push some Apple users into the hands of IBM, which is precisely where they don't want to be.

Apple itself seems to be in a state of confusion, perhaps due to its rapid growth and its attempt to enter the serious business market. Many Apple users believe that it has become imperative for them, Lisa and XL users in particular, to make their voices heard in terms of what they want from the manufacturer they have dedicated so much time, money and, in several cases, heartfelt loyalty to.

For this reason The NetWorkers is sponsoring a teleconference on the fate of the Lisa and XL. The conference will be moderated by George Por, an internationally known telecommunications expert and co-author of a forthcoming book on Macintosh Telenetworking. The conference will be held on June 19th, starting at 5 pm PDT. Hard copies of the conference will be made available to the general public after June 26th. For more information please call or write: The NetWorkers, 3500 Market Street, #103, San Francisco, CA 94131, (415) 550-1710.

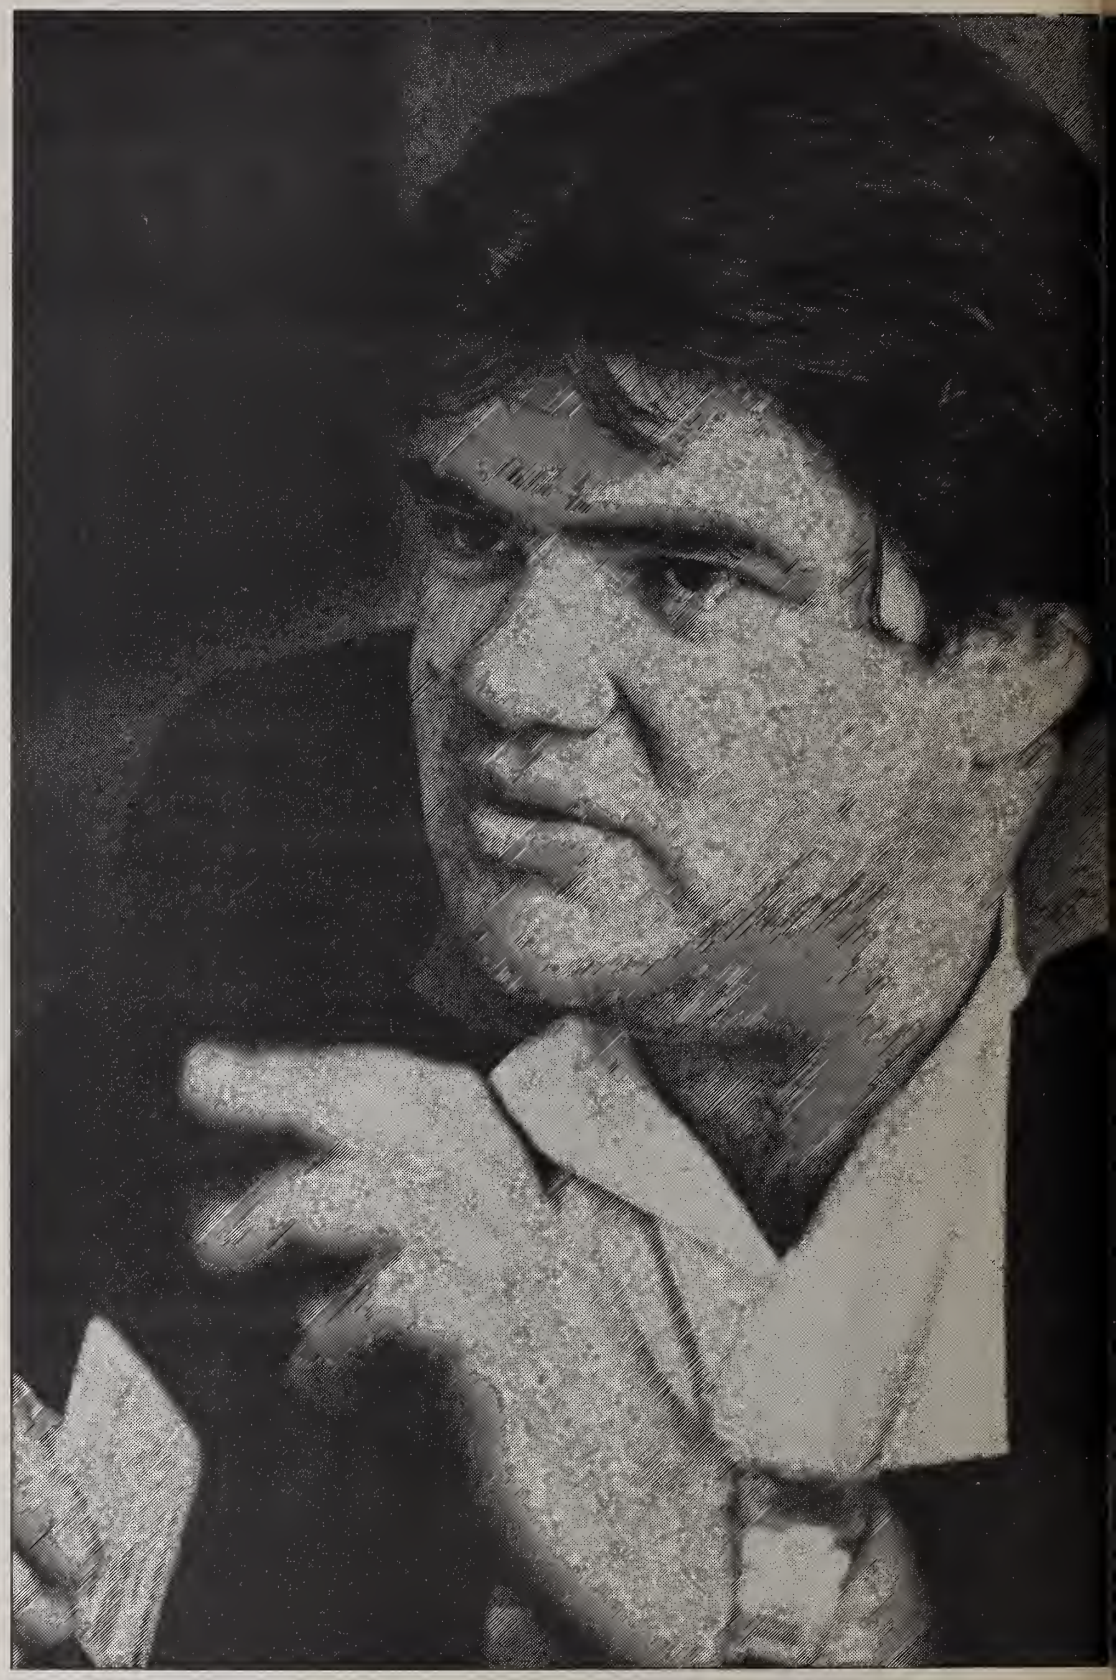
Borland's Software Anarchist, Philippe Kahn

Surprising People And Disturbing The Establishment



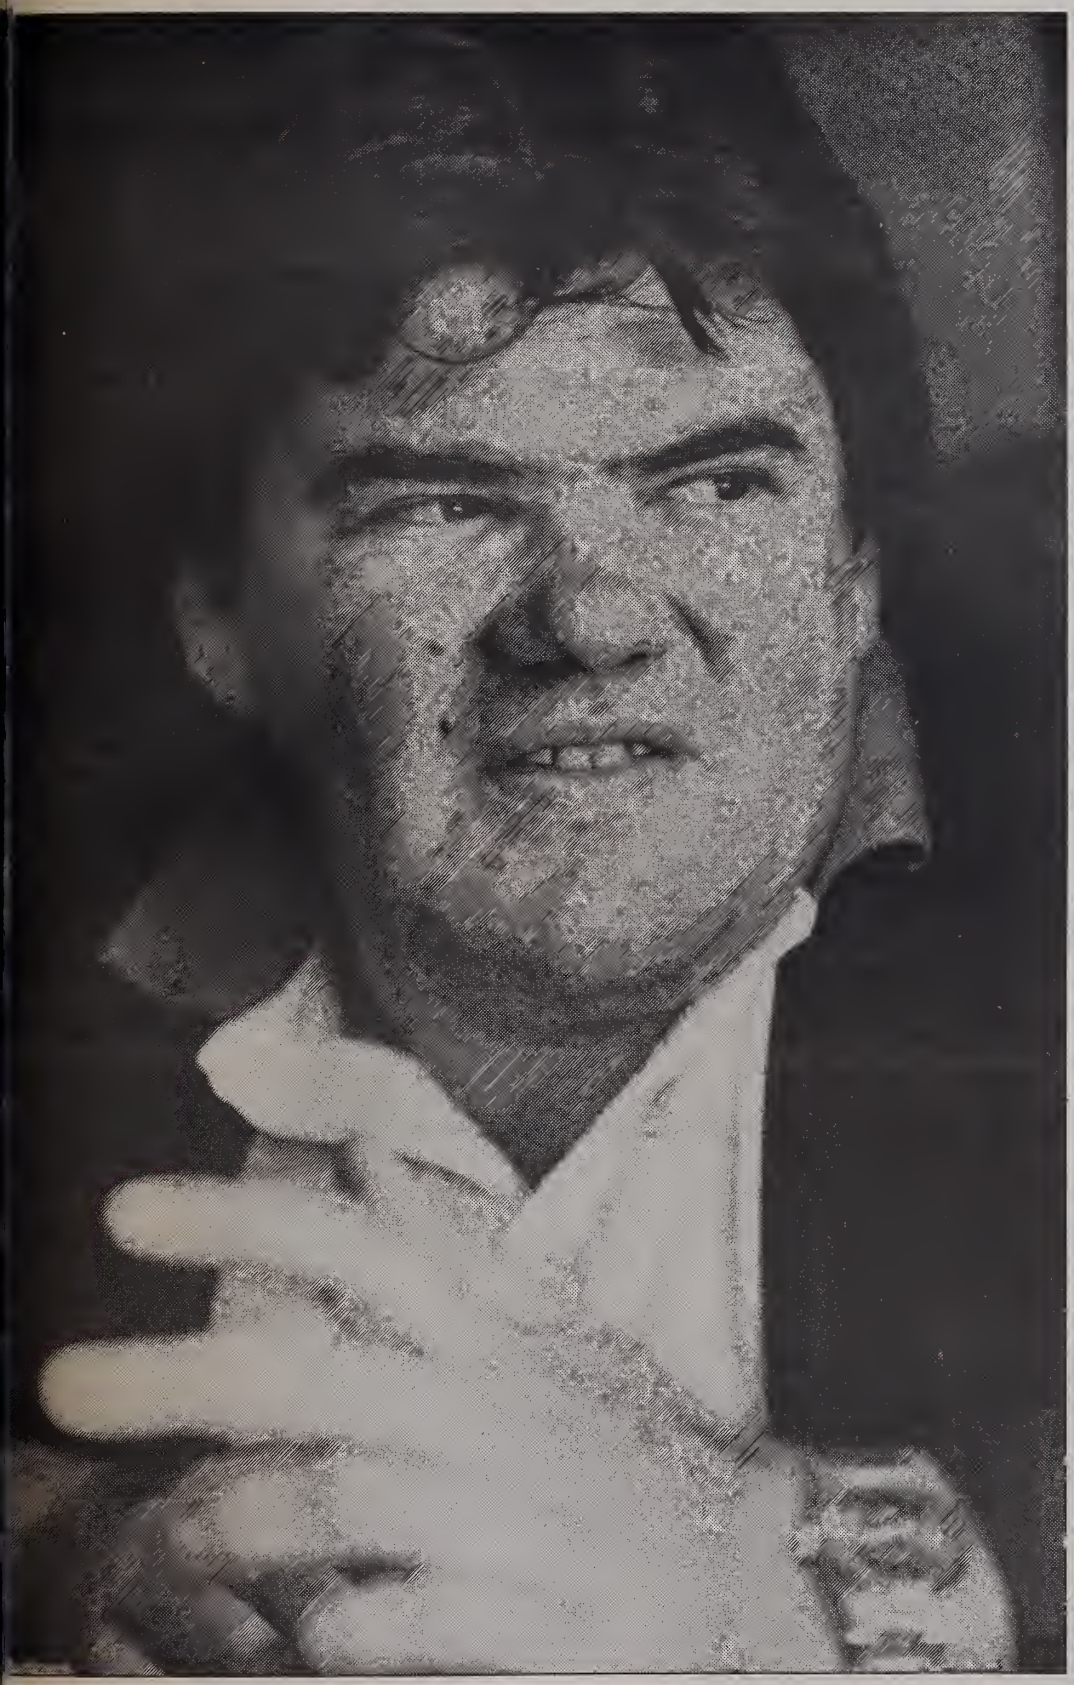
They said it couldn't be done, of course: selling top-quality innovative software for extremely low prices. Philippe Kahn, newly arrived from France and unable to find work in the industry since he didn't have a green card, didn't believe them. In 1983, he founded Borland International, which, with products like *Turbo Pascal* and *Sidekick*, has been turning the software world upside down ever since.

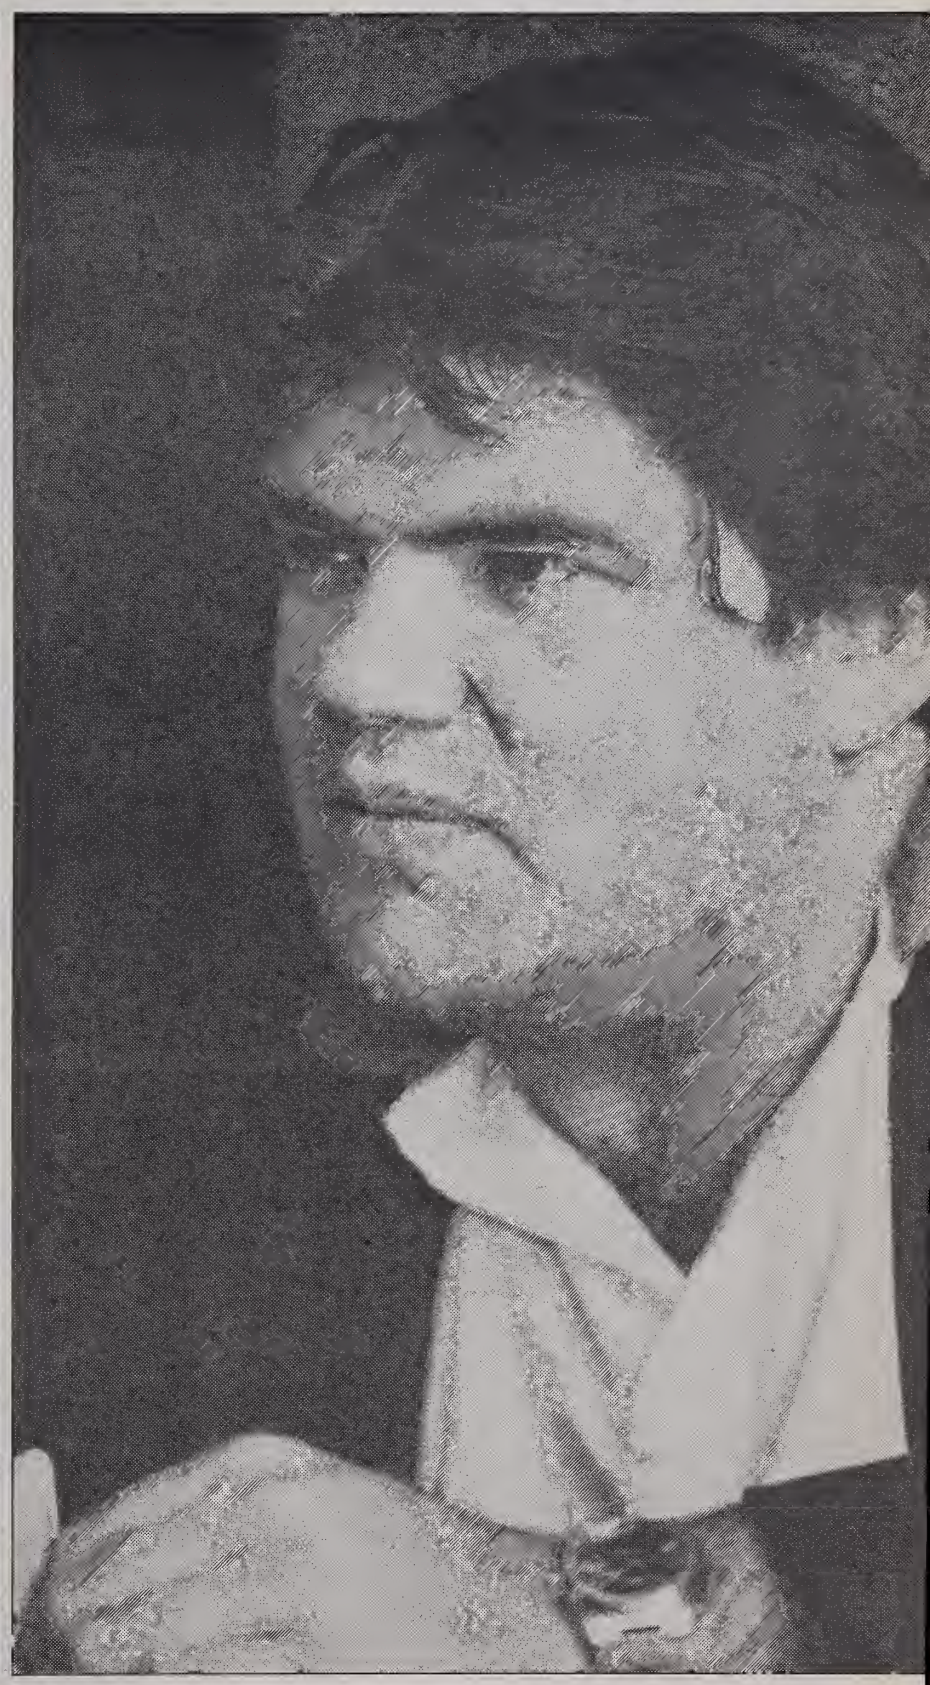
By Jeff Spurrier

The interview with Philippe Kahn, President of Borland International, took place at the company's crowded offices in Scotts Valley, near Santa Cruz. In keeping with the Borland image, most of the staffers appeared to be young, friendly, and easy-going. When Philippe Kahn arrived just before noon, he spent a half hour touring the various departments, checking up on what was going on. Most of his own programming work he does late at night at home, he later explained, since when he's at Borland the daily demands of the company require his attention. Besides

Photos by Ann Summa

"We want to do business our way," says Borland International president Philippe Kahn, "and I think our end users respect us. People in this business are too greedy to get rich. We never started this company hoping to become millionaires."





having an office at home, he also has a cellar full of electronic keyboards and computers.

***Sidekick* is one of your biggest successes; in one interview you made its development sound like almost an accident...**

Any new idea is almost an accident. If it's not, it's probably not that new. If it was possible to arrive at new ideas by logical patterns, then you'd have machines and people trying to do that all the time. It's like you're in your jacuzzi and you look at the bubbles and boom! You have an idea. Is that an accident? Of course if you sit at a conference table with ten people and say 'We're going to come up with a new product!' and six hours later you have it knocked out, I don't believe it's going to be great.

Is that what's wrong with a lot of software today?

No, I think what's wrong with software is the positions (of companies). We have something which I call the Basic Laws of Turbo Dynamics. First: high quality software; second: not copy-protected software; third: reasonable licensing agreements. All this makes what I call good software. What's wrong with most software today is they fail in terms of copy-protection. That is going to be a major issue in the next year. No matter how you look at it, copy-protection is a hassle to the user. It's a tax on honesty. It's like going to the grocery store and every time you leave the store you're searched. When you go in there they assume you're guilty. I think it's a fundamentally wrong idea. It's a wrong way to start doing business with people. So I think there's going to be a reaction in the marketplace to it.

Now as for licensing agreements, if you look at the licensing agreement on any product, you'll need three lawyers to understand what it's about. Our licensing agreement is called "Borland's No Nonsense License Statement." [He then reads verbatim the Borland licensing statement, a brief paragraph which simply states that the software is protected by U.S. copyright law and is to be treated much the same way as a copyrighted book would be. Backup copies are permitted but duplication for use by more than one user at a time is forbidden.]

That's it. Now compare it with any piece of software. [Kahn then reads a non-Borland licensing agreement.] They don't guarantee anything. It's called the "No performance warranty." Isn't this amazing? "[Manufacturer] cannot and does not warrant the performance or results that

"No matter how you look at it, copy-protection is a hassle to the user. It's a tax on honesty. It's like going to the grocery store and every time you leave the store you're searched. When you go in there they assume you're guilty. It's a fundamentally wrong idea."

may be obtained from using the program . . . The entire risk as to the results or performance of the program is assumed by you. Should the program prove defective, you and not [manufacturer] shall assume the entire costs of all necessary services and corrections." [Laughs] Do you know any industry where anyone would dare sell something like that? And the Lotus one is worse. Can you imagine an industry where it's written on the product that it's useless, it doesn't work, and you can't copy it, and by just opening the package you accept all those terms? Isn't this crazy? This is what the software industry is about these days.

How do your lawyers feel about your "No Nonsense Statement?"

We don't ask the lawyers. If you ask them then you end up with what everyone else has. That's what's crazy. We believe what protects software is copyrights, so we rely on them. Period. Just like books or music. And we contend that our software does what we say it does. The *Turbo Pascal* is a Pascal programming language and *Sidekick* is a resident index software organizer. We don't say it's nothing! You just bought nothing! Like with Lotus you just paid $495 for nothing!

At one time *Sidekick* was copy-protected. I thought...

Yes. That was because this advertising guy that worked here convinced me to copy-protect the product. And when I saw the reaction from end users I immediately released a non-copy-protected version of *Sidekick*. I also released the advertising guy. That was the first and last time Borland will copy-protect a product. That was June last year.

If you are a software publisher, and you don't use your software yourself, that means you're in trouble. It's not useful. And I would never use a copy-protected version of *Sidekick*. It's like if you're in the music business and you never listen to the songs you publish. You're in trouble. Or if you're a book publisher and you hate the books you publish. We're users. We have some 80 PCs in here and everyone uses our software.

Besides copy-protection, what do you think is wrong with most software?

Fundamentally that it doesn't work. A lot of the people who write software probably never get to use it. A group of programmers are commissioned to write something, and after they finish it they move on to the next task. If they did use it they'd find it's hard to use, not fast, took up too much memory space. People talk about user-friendly software, but the first element of user-friendly is speed.

And you think that's the primary cause of bad software—program designers who don't use their own product?

That's one reason. A lot of times the motivation for people to make software is to make money, and that doesn't make good products. It's the same with music. If you're making music just to make money, I don't think it'll be good music. It'll probably be okay, if you have talent, but it won't be good. It's the same with software. You have to like what you do, have fun at it. It has to be a creative environment in the company — which is often not the case. I don't believe having more than 10 or 15 people doing programming in one location is productive. Lotus has a hundred people in a building doing development. That kills creativity.

Why?

Too many people and too much organization. Nobody knows anybody. No one can manage that. I believe in teams of ten or fifteen who know very well what the other guys are doing and act as sounding boards and are isolated and get excited about small projects.

A lot of your catalogue is language-related programs. Why?

"A lot of times the motivation for people to make software is to make money. And that doesn't make good products. It's the same with music. If you're making music just to make money, I don't think it'll be good music."

Communications. That's how you talk to computers. We believe that's serious business. If you want to build a company that's here in the long run you don't want to be in the hits business. Lotus is in the hits business. They've got *1-2-3*, and they need another one. And because they can't find another one they have to become an obnoxious sue-people copy-protect software company to protect their revenue.

We believe the backbone of our business is programming languages

Borland International

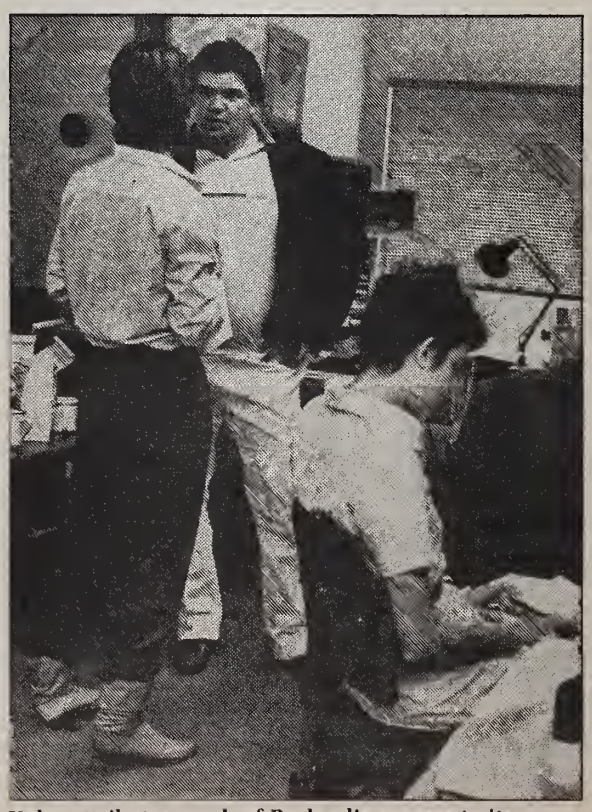
BREAKING THE RULES PAYS OFF

Ever since Borland International set up shop in late 1983, the small software house has refused to play by the rules. Besides offering drastically lower prices for top quality software, Borland went against the tide by concentrating on the less glamorous side of software—language programs, specifically Pascal-related programs.

Despite initial skepticism from industry insiders, Borland's debut offering, *Turbo Pascal* (released in November 1983) sold over 15,000 copies in four months. Within a year it had sold more than ten times that amount.

That success was far surpassed by Borland's second product, *Sidekick*, an "electronic organizer" that features a set of interactive, integrated windows, allowing a user to perform a variety of tasks without leaving a resident program. With *Sidekick* in operation, one can have *1-2-3* or *Wordstar* loaded while having the ability to take notes, do calculator computations, dial the phone, jot down appointments on a calendar, or perform ASCII conversions at the same time.

As Borland approaches its second birthday it has a full range of Pascal programs on the market including *Turbo Pascal* (for Z80 and 8088/86 microcomputers), *Turbo Pascal 87* (for 8087 support on 16-bit machines), *Turbo Toolbox* (a program that works with *Turbo Pascal* and includes fast file access and sort capabilities), *Turbo Graphix Toolbox* (which provides a set of graphics to be used with *Turbo Pascal*) and *Turbo Turtle* (an introduction to Pascal with guidelines for developing assembly language procedures). *Superkey*, shipped in February, is a keyboard enhancement program which allows users to design a keyboard for their own personal use, replacing frequently used commands and/or text with a single keystroke.



Kahn attributes much of Borland's success to its creative teamwork in small groups.

Despite its small catalogue, Borland is clearly doing something right. The company was named "Company of the Year, 1985" by *PC Magazine*, and *Sidekick* was named "Product of the Year, 1985" by *Infoworld*. In addition, *Turbo Pascal* was included in the Top Ten Products of 1984 by *PC Week* and the language has been selected as the official language for a national student programming competition.

And what's up for the future? Philippe Kahn knows but he's not talking . . .

"Oh, there are lots of new things but our policy now is that when something new is ready we'll call a press conference to announce it and the same day we'll ship it," he says. "We're working on six or seven products now but there's nothing we want to pre-announce."

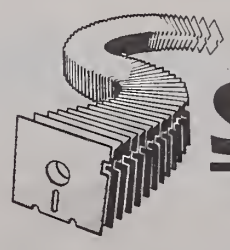
— Jeff Spurrier

DOES HUGHES KNOW SOMETHING YOU DON'T KNOW?

When they want something they know how to get it - now. They know where to find reliable suppliers, fair prices and follow up service on products they buy. They know they don't have to change their corporate accounting procedures to get it. And that's where we come in.

They know we are business software specialists. That we are in the neighborhood so their employees can drop by to select and demo programs. And they know they can come by anytime for follow up assistance working through special problems.

They know mail order just doesn't provide service, speed and accounting flexibility. They know we can tailor our service to fit their needs. Whether the order is for one program or a thousand. Or whether they need it this afternoon or next week.
And now you know.



SIMPLY SOFTWARE
we get the hard to get

because they'll always be around. It's not a hits thing, it's a necessity. For education, for business, for hobbyists. That's our main strategy now. We will have the Basic language, C, Modular 2, assembler, with the same strategy—a whole group of products [like the Pascal series]. Look at MicroSoft, that's a solid company. They built the company around languages. The hits business is fun and we've got two hits now, *Sidekick* and *Super Key*. But one day we'll miss, and if you base your whole strategy upon hits you'll be in trouble.

You've made a point of avoiding borrowing money to build Borland through venture capital, yet everyone else in the industry does this. Why are you so adverse to venture capital?

Because we want to be independent. As soon as you have outside investors then you have to abide by their rules — copy-protect software, protect the company with stupid licensing agreements. We want to do business our way and I think our end users respect us. By protecting our customers we do protect our shareholders. Most companies don't believe that. It's a different philosophy [from most software businessmen]. People in this business are too greedy to get rich. We never started this company hoping to become millionaires, just to make a decent living. I didn't have a choice. I was broke and no one wanted to hire me in those high tech jobs because I didn't have a green card. The idea was to survive. We probably have become "millionaires" although I haven't ever checked. That was never the goal and that's

"A lot of software companies are saying, 'Borland's not viable. You can't make a business by selling software at this price.' So why do they worry? Why do they scream? We'll go out of business. I think by now they know we won't."

probably why it worked—because it wasn't important for us. What was important was to have fun and make great products and make our customers happy.

Is there any plan to bundle your software with hardware or software manufacturers? Recently you signed a deal with AST to include *Sidekick* with every board they ship...

We don't bundle. I hate that word, I hate the words "free software." Those terms were invented by Adam Osborne and now that he's in the software business he feels bad about it. Software is not free and if you give the people the idea that it is, then, sure, they'll copy it and rip you off. The AST deal is a distribution agreement — a fantastic distribution deal for us. They ship over 40,000 boards a month and in addition to what we sell, more than 40,000 other people are going to get an edition of *Sidekick* and a catalogue of Borland products. It's a distribution deal, not a bundling.

Usually when they have bundled or free software it's second-rate software that's not selling anymore and they put it with hardware to generate revenue. *Sidekick* is a best-seller now. What we did was take the best-selling add-on piece of hardware for the PC, which is the AST SixPak Plus, and the best-selling product for the PC besides *1-2-3*, which is *Sidekick*.

It's a joint venture, an alliance. We believe in putting our products in as many hands as possible. There might have been some resistance because of how low we price our products. People say, "I didn't buy *Sidekick* because it was too cheap. I bought the expensive one."

Do you think that people think that *Sidekick* is a game because it's priced so low?

I hope people do think it's a game.

Really?

Sure. If it can make your daily work like a game instead of work, it's wonderful. If using business software can feel like playing a game that's great. That's one of the taboos. A computer should be fun to use.

Do you think your low prices upset other software manufacturers?

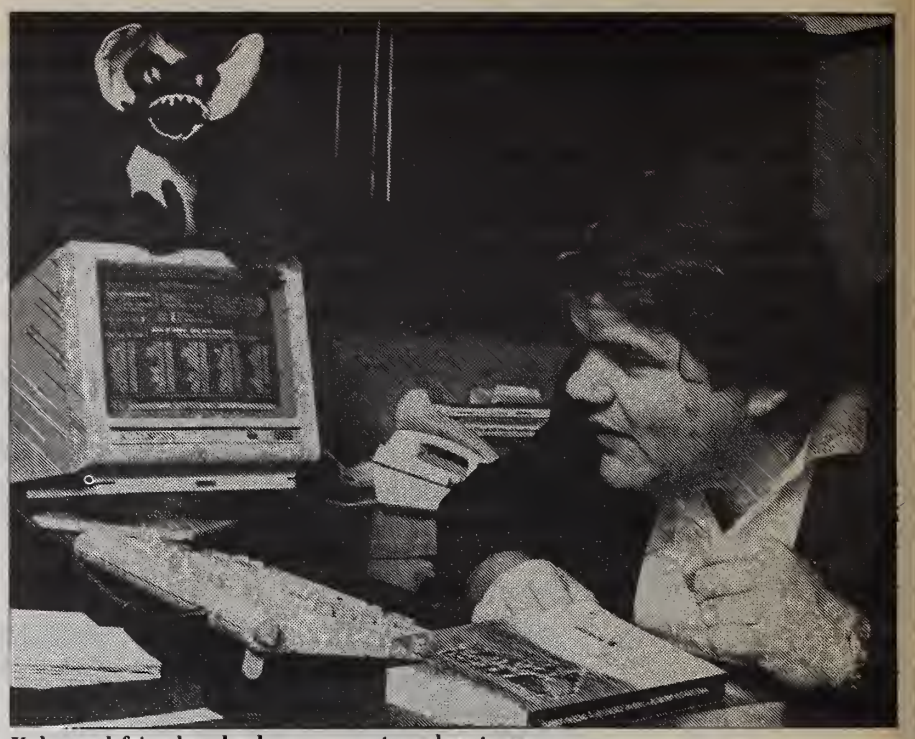
I don't care if it upsets them or not. I think it pleases our customers. If they're upset then there's a problem.

A lot of software companies are saying "Borland's not viable. You can't make a business by selling software at this price." So why do they worry? Why do they scream? We'll go out of business. They shouldn't worry about it.

I think by now they know we won't. I think it's a general trend. Software prices will go down, and we've been the ones that have done it first, and we'll continue to push them down to reasonable levels. It's true in any industry, it always happens. Software was a new industry. Now you have 8 million PCs so you don't need to sell a piece of software for $600 to make a good living if it's a pretty horizontal product.

I've heard that sometimes you log on to the Go Bor board on CompuServe to chat with users. Why? How do people react when they realize they're talking to the head of Borland?

With amusement. I do it because we want to be end user oriented, so we want to hear what they have to say.



Kahn and friend embark on computer adventures.

And what do they say?

Suggestions. It's amazing how by listening to them you can have great ideas for products. Instead of having three or four guys here trying to think of new products you suddenly have 25,000 people giving you great ideas. For free—if you're willing to listen. I always want to see the complaint letters as well as the compliment letters. We don't get too many complaints but sometimes we do. You get a lot of suggestions by users, because they do different things with the product and might have ideas you didn't have, because you didn't use the product with some other software or some specific condition.

Are you open to outside developers submitting to you?

We are, but we haven't seen anything we want yet that will meet our criteria. So far we develop everything ourselves. I'm very scared of the VisiCorp/Software Arts syndrome. Software Arts developed *VisiCalc* for VisiCorp and then they started fighting about it. Software Arts wanted the glory and more money. They were getting $14 million a year just to sit there. Two guys. They didn't upgrade the product for VisiCorp, so they lost the market and Lotus came in and bought them out. So we're very scared of that kind of relationship. I believe in controlling your technology. As long as you control your technology, you have the ability to create new versions, upgrade your software.

Do you worry about industrial espionage?

Within the company? Yeah, we're becoming more cautious. We've been had a few times. One guy left with a few ideas we'd had and tried to start his own company, but he failed because he didn't have the ability to make software. Thinking of ideas is one thing but making it work is another. He even raised capital and persuaded investors that he had good ideas. So now we're very careful about new ideas.

What do you see in the future for software design?

I don't think anybody sees the future. If people tell you they see the future, don't believe them. When a company becomes established — as we're starting to do—they like to say they can see the future. But no matter how you look at it, a couple of guys in a garage somewhere—like we did—will come and show everybody. That's the beauty of the software industry. You don't need big capital investment to make a great piece of software. People say it's a marketing game, but that's not true. It's a technology driven game. If you don't have the marketing you might fail. But if you just have the marketing and no product you're sure to fail in the long run. You must have good products. That's cast in iron. You can't create something out of nothing.

You have children. What do you think kids will be doing in 20 years on computers?

Kids are amazing because they're not afraid of programming like adults. Twelve-year-olds will start writing Pascal programs right away. My impression is that [future kids] will blow us out, make us look real bad. They're so natural and in tune with the object. It's going to be tough coping with them. It's like someone who touches his first piano at 20 compared to a kid who starts when he's four and he's a natural. Like young Mozart and Salieri in *Amadeus*. It's amazing. I see my kids and they understand things so easily. We'll see lots of new directions in software coming from kids because it's the first generation that has had real tools, real computers at the age of five or six. What kind of musicians would we have if nobody could touch a piano until he was in college? Suddenly you've got a whole generation who has gotten computers when they're five or six and they have les-

SUPER PACKAGE SPECIALS

PACKAGE #1
IBM PC 640K COLOR COMMUNICATIONS SYSTEM

- IBM 256K, 2 360K DS/DD FLOPPIES, KEYBOARD
- DOS 2.1
- CHOICE OF TAXAN 420, PGS HX-12, OR AMDEK 600 HIGH RESOLUTION RGB COLOR MONITORS
- COLOR GRAPHICS ADAPTER
- MULTIFUNCTION BOARD WITH PARALLEL PRINTER PORT, SERIAL PORT, GAME PORT, CLOCK/CALENDAR, RAM DISK, PRINT SPOOLER, and 384K RAM TO UPGRADE ENTIRE SYSTEM TO 640K TOTAL MEMORY
- CHOICE OF FRAMEWORK INTEGRATED SOFTWARE OR DBASE III DATABASE MANAGEMENT SYSTEM
- CHOICE OF OKIDATA 92 DOT-MATRIX GRAPHICS PRINTER OR STAR MICRONICS DS-10 LETTER-QUALITY PRINTER
- PRINTER CABLE
- BIZCOMP INTELLIMODEM-SR 1200-BAUD INTERNAL MODEM WITH INTELLISOFT COMMUNICATIONS SOFTWARE
- COPY II PC V2.4 (SOFTWARE UTILITY TO BACK-UP COPY-PROTECTED SOFTWARE)
- MONITOR TILT/SWIVEL BASE
- SURGE SUPPRESSOR & NOISE FILTER

ONLY $3,819.00

PACKAGE #2
IBM PC 640K MONOCHROME COMMUNICATIONS SYSTEM

- IBM PC 256K, 2 360K DS/DD FLOPPIES, KEYBOARD
- DOS 2.1
- CHOICE OF AMDEK 310A, PGS MAX-12, OR TAXAN 122 HIGH-RESOLUTION MONOCHROME MONITORS
- MONOCHROME GRAPHICS ADAPTER
- MULTIFUNCTION BOARD WITH PARALLEL PRINTER PORT, SERIAL PORT, GAME PORT, CLOCK/CALENDAR, RAM DISK, PRINT SPOOLER, AND 384K RAM TO UPGRADE ENTIRE SYSTEM TO 640K TOTAL MEMORY
- CHOICE OF FRAMEWORK INTEGRATED SOFTWARE OR DBASE III DATABASE MANAGEMENT SYSTEM
- CHOICE OF OKIDATA 92P DOT-MATRIX GRAPHICS PRINTER OR STAR MICRONICS SD-10 LETTER-QUALITY PRINTER
- PRINTER CABLE
- BIZCOMP INTELLIMODEM-ST. 1200-BAUD INTERNAL MODEM WITH INTELLISOFT COMMUNICATIONS SOFTWARE
- COPY II PC V2.4 (SOFTWARE UTILITY TO BACK-UP COPY-PROTECTED SOFTWARE)
- MONITOR TILT/SWIVEL BASE
- SURGE PROTECTOR & NOISE FILTER

ONLY $3,539.00

PACKAGE #3
IBM PC 640K/10MB HARD DISK COLOR COMMUNICATIONS SYSTEM

EXACT SAME SYSTEM AS PACKAGE #1, BUT WITH THE ADDITION OF A 10-MEGABYTE INTERNAL HARD DISK.

ONLY $4,529.00

PACKAGE #4
IBM PC 640K/10MB HARD DISK MONOCHROME COMMUNICATIONS SYSTEM

EXACT SAME SYSTEM AS PACKAGE #2, BUT WITH THE ADDITION OF A 10-MEGABYTE INTERNAL HARD DISK

ONLY $4,529.00

PACKAGE #5
IBM PC 320K COLOR COMMUNICATIONS SYSTEM

- IBM PC 256K, 2 360K DS/DD DRIVES, KEYBOARD
- DOS 2.1
- CHOICE OF TAXAN 420, AMDEK 600, OR PGS HX-12 RGB COLOR MONITORS
- COLOR GRAPHICS ADAPTER
- INTUIT INTEGRATED SOFTWARE
- CHOICE OF OKIDATA 92P DOT-MATRIX GRAPHICS PRINTER OR STAR MICRONICS SD-10 LETTER-QUALITY PRINTER
- PRINTER CABLE
- BIZCOMP INTELLIMODEM-SR 1200-BAUD INTERNAL MODEM WITH INTELLISOFT COMMUNICATIONS SOFTWARE
- COPY II PC V2.4 (SOFTWARE UTILITY TO BACK-UP COPY-PROTECTED SOFTWARE)
- MONITOR TILT/SWIVEL BASE
- SURGE SUPPRESSOR & NOISE FILTER

ONLY $3,179.00

PACKAGE #6
IBM PC 320K MONOCHROME COMMUNICATIONS SYSTEM

- IBM PC 256K, 2 360K DS/DD FLOPPIES, KEYBOARD
- DOS 2.1
- CHOICE OF AMDEK 310A, TAXAN 122, OR PGS MAX-12 HIGH-RESOLUTION MONOCHROME MONITORS
- COLOR GRAPHICS ADAPTER
- INTUIT INTEGRATED SOFTWARE
- CHOICE OF OKIDATA 92P DOT-MATRIX GRAPHICS PRINTER OR STAR MICRONICS SD-10 LETTER-QUALITY PRINTER
- PRINTER CABLE
- BIZCOMP INTELLIMODEM-ST 1200-BAUD INTERNAL MODEM WITH INTELLISOFT COMMUNICATIONS SOFTWARE
- COPY II PC V2.4 (SOFTWARE UTILITY TO BACK-UP COPY-PROTECTED SOFTWARE)
- MONITOR TILT/SWIVEL BASE
- SURGE PROTECTOR & NOISE FILTER

sons and and they have them at home. It's a big difference.

How old were you when you saw your first PC?

Probably 15 or 16.

Do you remember what you did with it?

Sure. I had a summer job programming geometrical shapes for numerical control machines. You had a machine that would make metal parts, and it was driven by a computer. You needed someone who would translate a drawing of a shape, like a bolt, into mathematical equations and then into the language which the computer would understand. It was a very non-creative job. And then later at university we had mainframes. My first PC was an Apple II, in France. That was the first I had at home that I could play with, with an assembler and all. It was a good machine. It was a great toy.

"Apple had this wonderful $2 billion company and they thought, 'We're going to take on IBM.' That's arrogant. You can't be arrogant with IBM. IBM is like a machine."

What do you think Apple is doing these days?

I don't know if they know what they're doing. It's really sad. Like a lot of people I think Apple made the industry. I would hate to see them disappear, because it's healthy to have competition. An IBM-owned world isn't a good world. IBM needs competition and Apple had the glow and the aura to compete. But they made a fundamental error with the Macintosh by closing the architecture of the machine. They'll probably survive — I hope so — they're rumored to have other machines. But what's still making Apple is the II and the IIc. It's not the Mac. It's amazing. The II is a dinosaur if you think about it. People say the PC is a dinosaur also, but the II is *really* a dinosaur. The II has been there for years. Everybody's hat should be off to Steve Wozniak. Everybody talks about Steve Jobs, but the reason Apple's here today is because of Wozniak's Apple II motherboard. I think the problems Apple has now is because the II people and the Mac people are fighting for recognition and it's obvious the II people should have it. They made the company.

Would you like to design hardware? What's the ideal computer?

Maybe no computer. It should be transparent to the user. You just think about it and it logs on.

The problem with those stupid computers is that they're very powerful when you have them, but when you're somewhere without them and that power you're lost. The hardware business is crazy. I wouldn't touch that for the world. Making another PC today is crazy. How many IBM compatibles are there — 80, 90? What are they bringing to the table? Nothing.

Essentially there is IBM, Apple, and then Atari and Commodore. Apple's main error was like what happened with minis and mainframes. There are all these companies like DEC and Data General that never realized that their real [mainframe and mini] market was the non-IBM customer. They all focused on IBM, never realizing their support base was the non-IBM market. Apple until now has not realized that their market is a non-IBM market. They can't look at IBM's market share and say "We'll eat a slice of it." They won't. That's IBM's. Traditionally. And Apple is going to be in trouble until they realize that, because Atari and Commodore and Wang and all these other companies will eat up the non-IBM market while they're focusing on IBM. It's a fundamental strategic error. They had this wonderful $2 billion company and they thought "We're going to take on IBM." That's arrogant. You can't be arrogant with IBM. IBM is like a machine. And even now they're still trying to go after IBM and show IBM people as bad guys through those ads — which are very creative, but do they sell PCs? I don't think they ever sold one more Apple because of those ads. They're image ads. And every time you waste money by selling image, essentially your customer is paying for it because your costs are going up.

You don't sell image?

No, we don't sell image. We sell products. All our ads sell products — not the company. We want people to buy products. Otherwise you end up building a cost structure that's not manageable at the price levels we're selling products. And then the consumer ends up paying the bills.

I get involved in the advertising and the R&D. I think advertising should be like news so that people learn something from it. I don't want people to think we're selling soap, with wonderful images. We do everything ourselves. We do all our R&D, our advertising, our banking — we don't have loans. We live in a little closed world here. And it's kind of fun.

What software do you like (besides your own) that's out now?

I do like our software. I like *Wordstar* still.

No *Microsoft Word?*

I think there are good ideas in it. They did a good job but it's too buggy yet and too slow for me. *Wordstar* is much faster and more powerful. I use *Wordstar* still, even though I have *Word*. I don't use database managers because I'd rather write them in Pascal with our toolbox. It's much easier to do and much faster and more efficient. And I have more control over things. The spreadsheet I like the most is *SuperCalc 3*. It's much better than *1-2-3* even though that's the standard.

You've made the comparison between software and book publishing. Do you really see the comparison so strongly?

There is a comparison in the act. We're selling a book with a diskette that sells for a little more than a hardbound book and we sell in much the same fashion. That's about where the comparison starts and ends.

When you buy a book you don't expect the characters in the book to change all the time. Software changes. It bugs, it reacts differently, it moves. You have upgrades. A book might have a new preface in the 2nd edition but that's all that's different. And you don't have technical support for books. And the process of creating also can't be forecast. It's a creative process — an accident like I said earlier. From that point on it's hard work, scientific work, coding, choosing algorithms. Getting things to work. There's nothing artistic about it. It's almost like playing a whole tune and then having to write it down in staff notation. There's not much artistic about all that — just hard work.

Do you see a connection between programming and music?

I don't know if there's a connection but I know that most people that are involved with software somehow are also involved with music — either they can play or have played or listen a lot. I carried my way through college playing music as a semi-pro in France. I used to play saxophones.

You don't play anymore?

Only when a party gets wild enough or I'm drunk enough to pick up a horn. I don't have time [to play] anymore.

Do you sometimes feel that maybe you got sidetracked from music? Would you rather be playing music?

I wasn't good enough to make a decent living at it. I like music, but you have to be damn good to make a decent living and be able to play the music you want to play. Most of the people I know who play music professionally don't play what they want. They do studio sessions, marriages, stupid stuff. They're making money okay, but I think they're having less fun than I'm having doing this, doing software. I was into modern jazz and that's really no way to make a living. Rock maybe but modern jazz . . . who makes a living? Not even the best guys. So, there are no regrets.

Do you foresee increased software competition coming from outside the U.S.?

Sure. If you look at the costs of development in the U.S. and programming here, smart companies will do what hardware makers did with production by setting up production facilities in Hong Kong or Taiwan. Development will happen overseas. There's no question. You already see it in the game business. A lot of the arcade games are not written in the U.S. anymore — some are written in the Eastern Bloc even.

Really?

Yeah, the Eastern Bloc is going to provide a lot of software development. We ourselves have two development centers overseas (one in London and one in Copenhagen) and we intend to set up a development thing in India also. You get excellent mathematicians and programmers there and the salaries are ridiculous compared to what you get in the U.S. A Ph.D. in India costs you $400 a month — and those people are smart. With hardware you need a lot of equipment. With software you don't need anything. Just a PC and a plug, and then you need a little brains. Software is freedom. Software is a direct extension of the human mind. It's just getting the machine to do things. It's not making dreams come true.

"Software is freedom. Software is a direct extension of the human mind. It's just getting the machine to do things, it's not making dreams come true."

Why don't you have a development center in France?

We have a saying in French: "No one is a prophet in his own land."

Do you think it's still possible for two guys in a garage to build a multi-million dollar software company?

Sure. We did it. If they have a great idea, no problem. People who say it can't be done just fear that it can't be done. I say it can be done. It's tough, but when we started everybody said it couldn't be done without $10 million in venture capital. But we did it. It's just people who love it to be impossible who say it can't be done — large software companies probably.

What kind of image do you think Borland has in the Silicon Valley?

Crazy guys who are trying to turn around the industry. I guess that's the image — software anarchists who do street marketing. That's the image I want the company and myself to have, that we're the wild cards. Whatever happens at Borland will surprise people and disturb the establishment. Maybe [the image is] the punk rockers of the software industry. □

ULTRA OFFICE

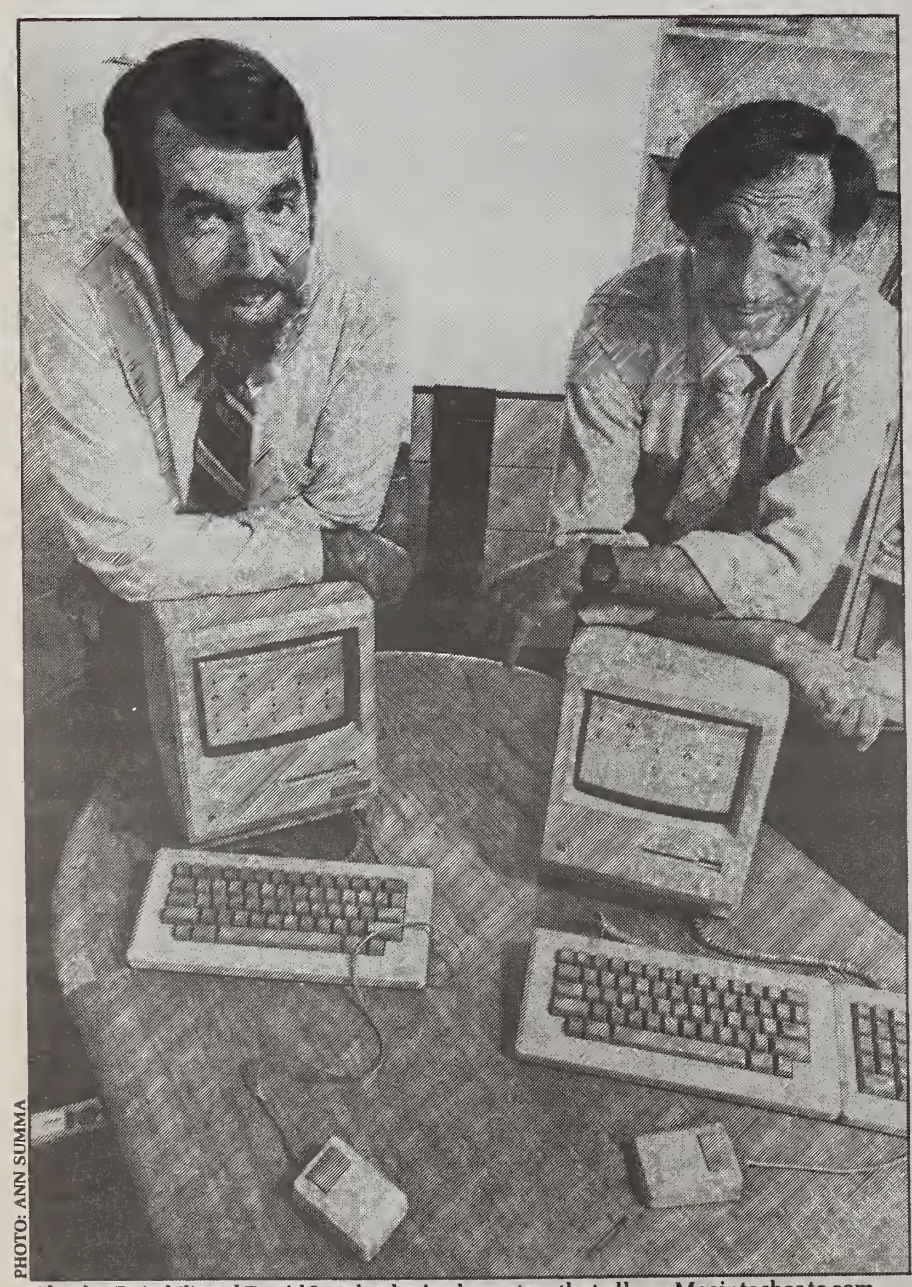

PHOTO: ANN SUMMA

Charles Baird (l) and David Lutzky devised a system that allows Macintoshes to communicate with a Unix operating system, combining the Mac's ease of use with Unix's power and versatility

Linking Unix With The Macintosh Office

By Carter George

With its recent introduction of the AppleTalk network and the LaserWriter laser printer, Apple Computer has begun a concerted effort to sell the Macintosh computer to serious business users. These business users are the same ones who have been flocking to buy IBM PCs for the last two or three years, and they represent a market that Apple covets. The trouble that the Macintosh has faced in breaking into this sector is that it is still regarded by many as more of a toy than a real business tool.

The Unix operating system, on the other hand, faces exactly the opposite problem. No one questions the power or "seriousness" of Unix. Unix is so powerful, in fact, that business has tended to shy away from it because it is supposed to be too hard to learn and too complicated to use.

Enter Lutzky Baird Associates, a small firm based in Los Angeles that has successfully effected the marriage of the Apple Macintosh to the Unix operating system. The result: a multiuser, multitasking office automation environment that is easy to use and offers extremely advanced capabilities and features. Lutzky Baird interfaced the AppleTalk network to a Zilog computer running the Unix operating system. Users of the Macintoshes on the network can use their Macs as standalone computers, or they can use software written by Lutzky Baird to access files and programs on the Unix system.

According to Charles Baird, President of Lutzky Baird, this is all part of a move to recognize the importance of information as a corporate asset. The Macintosh brings users to computing who would never touch an IBM PC, let alone a terminal connected to a Unix system. The combination of Mac and Unix can bring valuable and useful information to employees, especially in management and creative positions, who would not have used it before. "Until now, most companies have evaluated computers by whether they increase the firm's productivity. That is no longer the only reason to buy a computer system," Baird says. Improved communications, a better working environment, and more creative productivity are now things that can be expected from computer systems.

Baird still sees micros as the com-

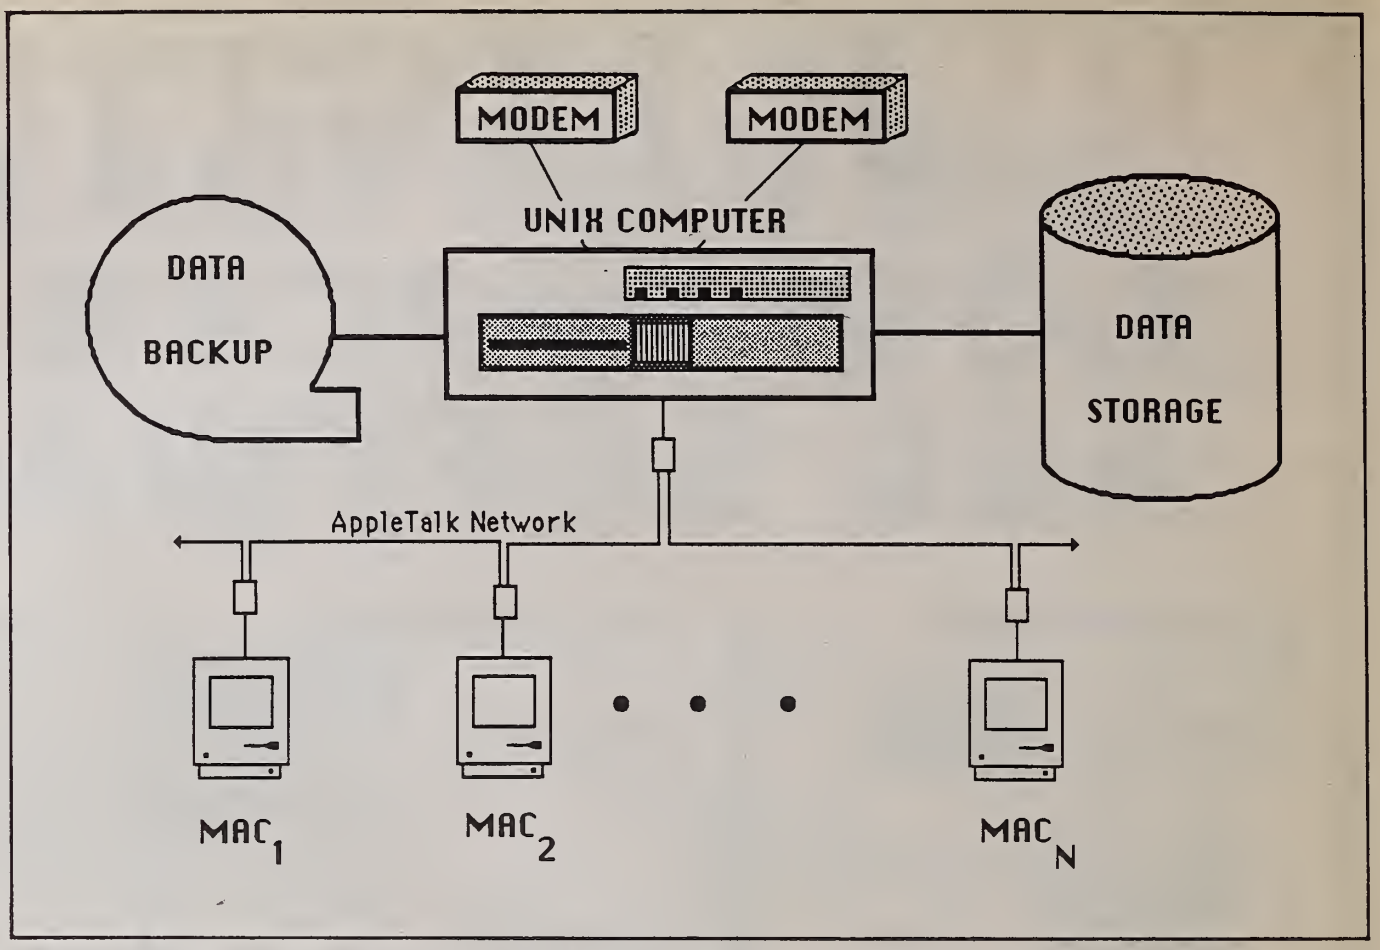
ing force in the computer world, but in many ways the standalone micro, like the PC and the Mac, has reached the edge of its limitations. Users of standalone micros can't communicate easily, their files can only become so large, and sharing a resource like a laser printer is difficult and slow even with most networks.

Multiuser computers, including Unix systems, address all these problems effectively, but have tended to be too technically complicated for most of the creative and management personnel who represent the main microcomputer marketplace.

This very problem caused Lutzky Baird to develop their product, called the UltraOffice. Originally high-tech aerospace consultants that specialized in satellite communications, Charles Lutzky and Dave Baird received a contract to provide an office automation system for a large ad agency. After an in-depth study (the results of the study fill a hundred-page report) they determined two things: 1) Only a large multiuser computer system would fill all the agency's needs for communications between users and technical sophistication; 2) The only computer the people at the agency would actually use was a Macintosh.

Faced with this situation, Lutzky Baird had two choices: sell the agency a multiuser system that met their requirements but that no one would use, or sell them dozens of Macintoshes that wouldn't let their employees communicate effectively and wouldn't let them develop some of the large database files they needed. Lutzky Baird took choice number three: develop a system from scratch that offered the best of both worlds. Says Baird, "You can't give busy people a system where they have to learn to do everything A, B, C, D. They don't have time to learn it, they won't do it." Systems today have to do what the users want *and* the users have to want to do them. The result is the UltraOffice.



UltraOffice system using a single Unix computer. The number of Macs that can be connected to a single Unix computer depends on the size of the Unix machine and the amount of activity performed on the Macs.

Says Baird, "You can't give busy people a system where they have to learn to do everything A, B, C, D. They won't have time to learn it, they won't do it."

In its first release, the UltraOffice lets Macintosh users send mail to one another and gives the AppleTalk network anywhere from 50 to 640 Megabytes of hard disk storage for files, depending on which of the Zilog/Unix systems is used. More sophisticated users, salty old programmers for example, can still access the Unix system directly using the Macintosh as a terminal.

The interface between the AppleTalk network and the Unix system is accomplished with a combination of both hardware and software. An intelligent communications board available from Zilog has been tailored to provide the hardware connection from the Zilog Unix system to the AppleTalk network. The board actually uses the same Zilog chip used by Apple in their network, and allows high-speed communication between the Zilog Unix system and several Macintoshes simultaneously. Software written by Lutzky, Baird, and Lutzky Baird technical whiz Dick Winge, implements the necessary communications protocols that allow the Unix system to communicate with the Macintoshes on the AppleTalk network.

At the Macintosh end, UltraOffice offers all of the visual appeal of the best Macintosh programs. It uses icons and pull-down menus in the same way that, say, *MacWrite* and *MacPaint* do. It is easy for anyone to learn, and for someone who has already had some experience on a Macintosh, would require little or no time to master. If you have ever used Unix, the first thing you will notice about UltraOffice is how it lets you browse through the Unix Directory system.

Each Macintosh user has a set of directories in his or her "library." There is an additional set of Unix directories in a public library, accessible by anyone on the AppleTalk network. When you list the contents of a directory in your library, all of your files are shown graphically on the Macintosh's bit-mapped screen. Subdirectories show up as large arrows pointing down, parent directories as arrows pointing up. To move to such a directory, all you do is move the Apple mouse to the arrow and click.

If you want to work on a file that is in a particular directory, you check it out. Files can be checked out "read only" or with complete access. Only one user can check out a file with complete access at a time, minimizing confusion. An unlimited number of users can check out "read only" copies of a file, even if someone else has checked out the file with complete permission to alter it.

Macintosh users can store files on the Unix system in their own library or in the public library. (These files are then stored as Unix files on the hard disk of the Unix system.) Retrieving a file from any of the libraries occurs in about the same amount of time it takes to read a file from the Mac floppy drive.

The other main feature included in the first release of UltraOffice is an electronic mail facility. The mail package lets any Mac user on the network send any number of messages to any other user. If you have received mail, UltraOffice sends you a message. You can look at a summary list of the mail waiting for your attention. You can read mail, forward it to other users, delete mail, or save it in a library or on the Mac floppy disk.

One limitation to the electronic mail facility in the current release is that mail cannot be sent to users who are logged in on traditional terminals

HIGH SPEED CMOS

A new family of high speed CMOS logic featuring the speed of low power Schottky (8ns typical gate propagation delay), combined with the advantages of CMOS: very low power consumption, superior noise immunity, and improved output drive.

74HC00

74HC: Operate at CMOS logic levels and are ideal for new, all-CMOS designs.

I have had nothing but good experiences with JDR and look foward to more of the same. It's not often a company is willing to help customers to the extent JDR has.

APPLE IS A TRADEMARK OF APPLE COMPUTER CO.

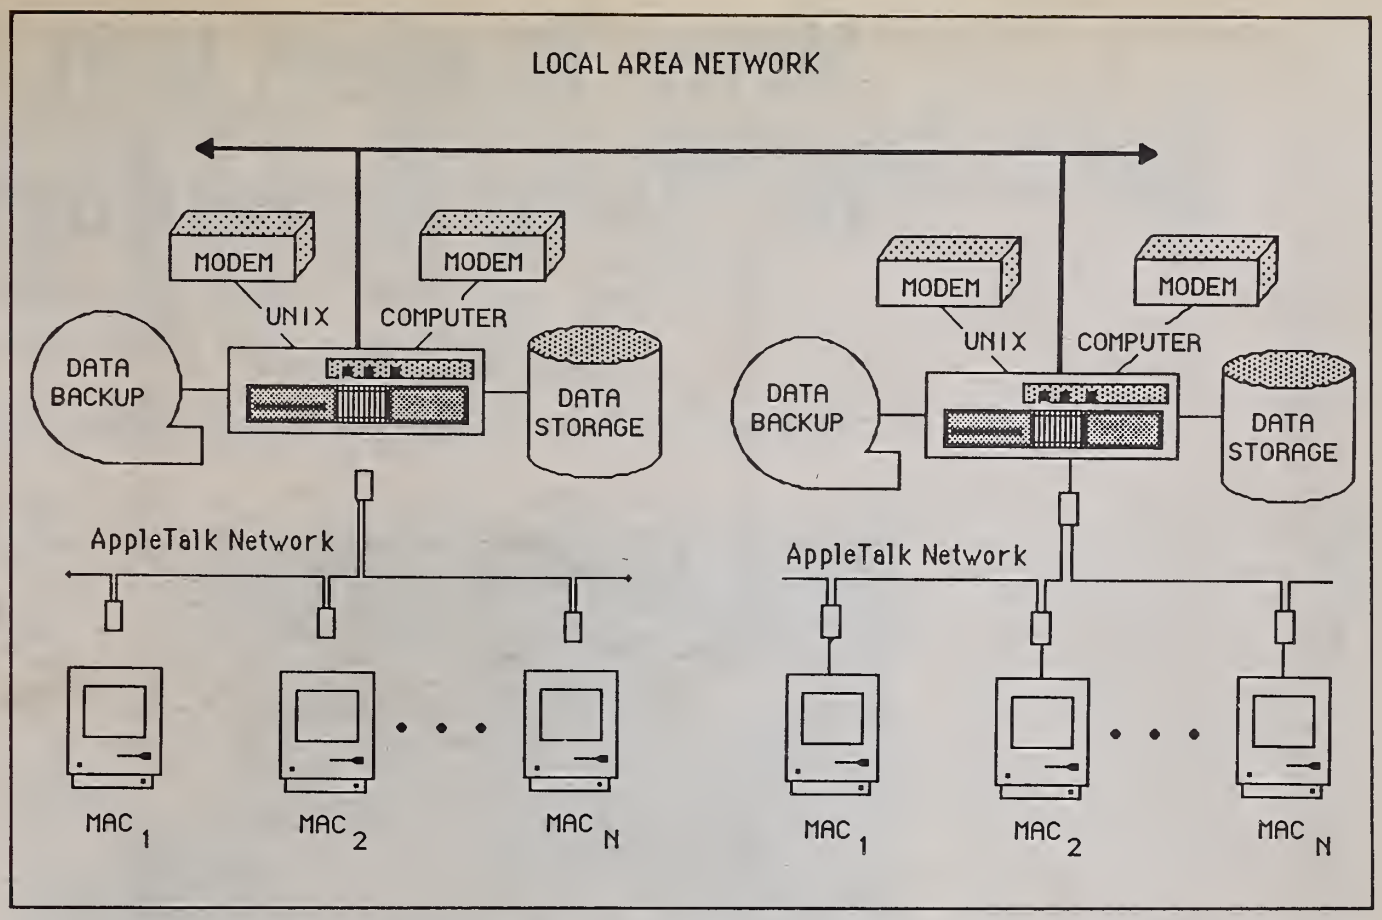
UltraOffice *continued from page 46*

as normal Unix users. Of course, Unix has its own very similar mail package that Unix users can use to communicate amongst themselves. At present, though, there is no way for Mac users on the network to communicate with traditional Unix users.

The second release of UltraOffice should solve this problem as well as add several significant new features. It will be available to owners of the first release as an upgrade included in the original purchase price.

In the second release, slated for the fall, the UltraOffice will include a spooling feature for the LaserWriter. This will mean that all requests to print files on the Apple laser printer will be copied to the Unix system and sent to the LaserWriter from there. The laser printer will no longer be attached to the AppleTalk network. Instead it will be connected to a standard serial port on the Unix system, allowing it to be accessed by custom Unix applications, as well as Macintosh programs like *MacPaint* and Aldus' new typesetting system *PageMaker*.

With the Unix system used as a spooler, no Macintoshes will have to wait for a print job to finish for work to proceed. Currently on an AppleTalk network without UltraOffice, the laser printer can cause several Macintoshes to have to wait. When a laser printing job is submitted, the Mac that submitted it must wait until it is done. If other users submitted print jobs before yours, you will have to wait until their jobs are done first, and then wait while your job is printed.



For systems too large to be supported by a single Unix computer, a local area network connecting multiple Unix computers provides high speed communications between computers located within approximately one-half mile of each other.

An unlimited number of users can check out "read only" copies of a file, even if someone else has checked out the file with complete permission to alter it.

The next release will also include the ability to execute more Unix commands, to send mail to Unix users, PC users, and other remote systems, and to network several Unix systems together.

The biggest feature of the second release, however, will be the way in which it works with Apple's soon-to-be-announced "Switcher." The Switcher is a program that allows several programs to be in memory at once. The Mac user can then switch from one to another almost instantaneously without having to wait for the program to load from disk.

The UltraOffice will be one of the programs that the Switcher allows to be always in memory. When this happens, UltraOffice will make the Unix hard disk appear as the system disk for the Macintosh. The floppy disk drive on the Mac will not be needed except to make copies of files. The Macintosh will then behave as if it were a true hard disk system, with almost no restriction on file size.

Lutzky and Baird see this as an incentive to third-party software and developers. "The most obvious application is database processing," points out Baird. A database could offload all of its screen processing and user interface to a process that runs on the Mac, he explains, while the Unix system would contain the actual data. This would mean that the data could be shared by all of the users of the network, and that the Unix system would have more processing resources free to be able to dedicate to rapid storing and retrieval of data.

The second release UltraOffice may seem like a pipe dream, but most of these features are already working in the ad agency that started the whole project. The agency is letting its offices be used as a master test site for the UltraOffice. In this site there are now almost 300 Macintoshes linked in a single network, using UltraOffice and Zilog/Unix systems.

Up to 40 Macintoshes can be linked to a single Zilog Model 32. Then, any number of Zilogs can be linked together using a high-speed Ethernet connection. All of the Ethernet networking of Unix systems is transparent to the Mac user: from UltraOffice it all looks like one huge file system.

Currently, the UltraOffice runs only on Macintoshes with 512K RAM and on Zilog's Models 12, 22, and 32 Unix systems. Lutzky Baird chose Zilog because it consistently benchmarked as the fastest small Unix system (the systems range in price from $19,000 to around $60,000 for a Model 32 with 500 Megabytes of hard disk storage). The company does have plans to include other Unix systems in its line-up, but no decisions have been made yet. The UltraOffice itself costs $2,000 per Unix system (including both hardware and software) and $300 per Macintosh. Also necessary is the AppleTalk network, available from Apple for $50 a connection.

For an 8 user system, based on a Zilog Model 12 with a 50 Mb disk drive and 8 Fat Macs, this adds up to about $50,000, including the AppleWriter laser printer and the necessary AppleTalk network connections. It is true that this is more than, say, 8 IBM PC/XT's. However, if one adds in the cost of networking it is not *that* much more, and the scope of capabilities is really in a different league altogether. It could well be that the success of the UltraOffice, and of products like it, will determine the fate of both Unix and Apple in the attempt to find an alternative to IBM in the corporate computing world. (Information about Lutzky Baird can be obtained by writing Lutzky Baird Associates, 5601 Slauson Ave., Suite 222, Culver City, CA 90230. Information about Zilog Unix-based computer systems is available from BASIS, 1700 Shattuck, Suite 1, Berkeley, CA 94707. BASIS also carries the Lutzky Baird UltraOffice.) □

Meter Readers Join The Micro Revolution

By Robin J. Dunitz

Pamela Gibson's new computer got an unexpected test its first day on the job, when a pit bull grabbed it right out of her hand. In spite of a few teeth marks, the 2½-pound Data Cap H worked fine when she finally got it back.

Southern California Edison's (SCE) employees consider the durability of the new machine as one of its best qualities. According to meter reader Denice McCreary, "When it rained, documents used to get wet. With Data Cap you don't have to worry; its being waterproof saves a lot of hassle." Company management, on the other hand, is especially pleased at how quickly the system has improved accuracy and reduced costs.

As of April 5th, all of SCE's 638 meter readers within the utility's 50,000-square-mile service area have been trained and are now using one of the $3,000 computers. Implementation of the system began in July, 1984, after a three month pilot program in Ontario, about 30 miles east of Los Angeles. Edison serves all or parts of 17 counties in Central and Southern California.

In shape the Data Cap resembles a heavy duty telephone receiver more than a portable computer, measuring 10.6 by 3.5 inches. It can either be held in one hand or hung from a waist or shoulder strap. Its membrane keyboard has 56 keys, most of which have at least two uses. With its many special function keys, it is easy to call up information like what side of a house the meter is on and whether to expect a dog. Other keys enable the user to enter such unusual conditions as a vacant house or a meter's broken seal. In another mode it is possible to write a message of up to 81 characters. Searching, while slow, can help locate an address or name out of sequence.

The Data Cap's liquid crystal display has two lines of 16 characters each. The unit uses rechargeable nickel cadmium batteries, which are recharged each night in one of SCE's 34 district offices.

The new portable replaces a handwritten system in which meter readings were recorded on cards and paper forms. These were then optically scanned by an in-house computer. The papers were easily damaged by bad weather, and, unless marked at just the right spot, could be misread.

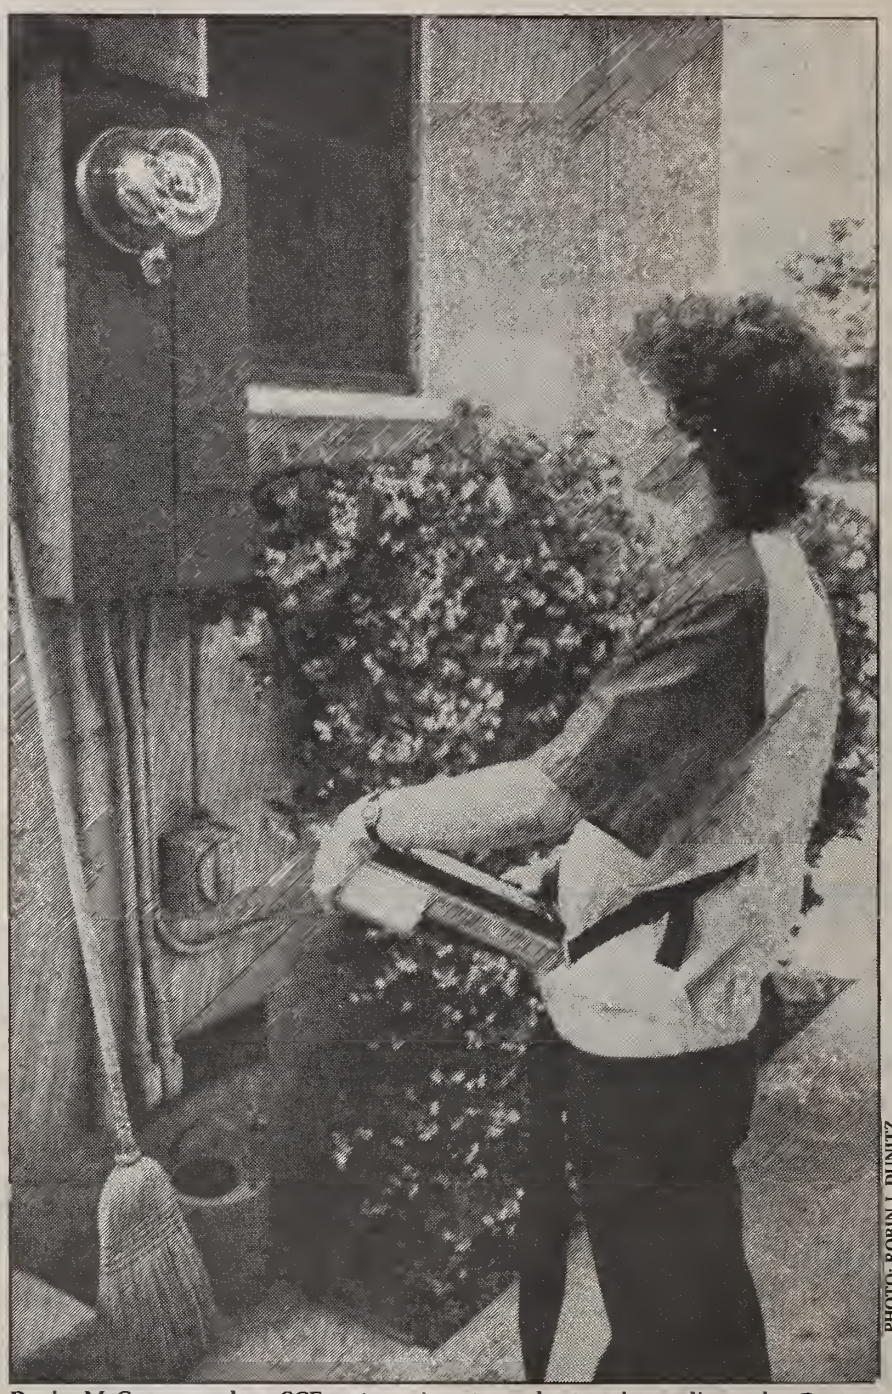


PHOTO: ROBIN J. DUNITZ

Denice McCreary reads an SCE customer's meter and enters the reading on her Data Cap H computer.

Now, with the new Data Cap system, in the morning each meter reader picks up a microcassette tape (or more than one, depending on the size of the route), programmed with their route for the day. The tapes are created at one of 66 work stations, which are called Data Management Centers (DMC) and are located in SCE district offices. Each DMC consists of a dumb terminal and two to four cassette tape drives, and is connected by modem to one of SCE's six minicomputers. These IBM Series 1 minis, located at the company's headquarters in Rosemead, store the electricity records of the utility's 3.4 million customers. At the end of the day the meter readers turn in their tapes, now having all the meter figures on them, and the information is uploaded through a DMC back to one of the minis.

Each cassette tape can hold about 200 accounts, having 160K of memory. The Data Cap itself uses an 8-bit, RCA 1802 microprocessor. Its custom-written language is called EDL (Event-Driven Language), and is a low-level assembly-type language. The actual coding was done in Forth.

Southern California Edison is the largest customer of Spokane, Washington-based Itron Inc., which developed the Data Cap H specifically for SCE, including both the hardware and software. SCE paid Itron $3.5 million for its new system. For the past seven years Itron has provided portable computer equipment exclusively for utilities throughout North America. The company now has over 50 clients.

According to Mike Stephens, Supervisor of SCE's Customer Service Systems, the company was almost immediately impressed by the "dramatic impact in reducing errors and costs." Meter reading accuracy is now close to 100% because the Data Cap requires a second reading if the first is outside a customer's usual range. This simple verification tool has meant a 40% decrease in the need for follow-up meter visits. Not surprisingly, the related cost savings have been significant.

While meter reader Denice McCreary appreciates the Data Cap's help in catching errors, and the way it enables her to make changes when they're "still fresh on my mind," her overall support is somewhat qualified.

Denice feels Data Cap saves other company employees, like those in accounting, more time than it does the meter reader, due to the slow speed at which the portable carries out certain functions. For example, some long routes require more than a single cassette tape, and that can mean stopping to change a tape while in someone's backyard. Often either the resident wonders why you're standing there so long, or a dog has more time to cause trouble.

Another problem, bad batteries, seems to have been mainly corrected. When Denice was being trained, she had the chance to take a Data Cap home in order to practice with it. She didn't get much chance as the unit's battery failed almost as soon as she turned it on. "Sometimes a battery fails in mid-route, and you have to come back to the office for a new one," she says.

If you're a customer of Southern California Edison, be sure to ask your meter reader to show you the Data Cap. Now that they're used to it, there's a good chance that they enjoy being a part of the micro revolution. □

Dac-easy accounting

$49.95

Introductory Price
Expires 6/30/85

price effective 7/1/85: $69.95

The software revolution of the year!

All 7 complete modules on 1 disk! Compare our features with other packages costing thousands more!

General

- Menu Driven • Fully Integrated
- MS-DOS & PC-DOS
- RUNS ON PCjr, PC, XT, AT, AND COMPATIBLES
- Password Protection In All Programs
- Slipcased Binder
- OVER 300 DIFFERENT REPORTS!!
- OVER 90 ROUTINES!!
- File Capacity Limited Only By Disk Space
- Service Contract Available
- ONLY $49.95 FOR ALL 7 MODULES
- Money Back Guarantee

General Ledger

- Double Entry • Unlimited # Of Accounts
- Multi-Level Accounting
- Unlimited Departments
- 3 Year Account History For CRT Inquiry
- Pencil & Pen Feature To Correct Mistakes Without Reverse Entries
- UNIQUE Budgeting Routine (See Forecasting)
- CRT Voucher Inquiry
- All Reports Compared to Last year or Budget
- Unlimited Journals

Accounts Receivable

- Open Item or Balance Forward
- 7 Customized Columns For Aging Report
- Unlimited # Of Customers
- Mailing Labels With 4 Different Sorts
- Automatic Finance Charges
- Supports Partial Payments • Directories
- 3 Year Customer History for # Of Invoices, Sales, Costs, And Profits
- Customized Text On Statements
- Cash Flow Analysis • Sales Analysis
- Automatic Sales Forecasting By Customer, Salesman, Or Customer Type

Accounts Payable

- Check Printing • Automatic Allocation Of Available Cash To Payables
- Vendor Directories With Sorting By Vendor Code, Name, Or Territory
- Aging Reports With 7 Customized Columns
- Unlimited # Of Vendors
- Mailing Labels • 3 Year Vendor History For CRT Inquiry And Printing
- Flexible Payment Calendar
- Automatic Forecasting of Purchases
- Unlimited Allocations Per Invoice
- Up To 10 Invoices Paid Per Check

Inventory

- Supports Average, Last Purchase, And Standard Costing Methods • Physical Inventory
- Accepts Any Measure Units Per Case Like Fractions/Dozens/Gross/Etc
- Automatic Changing Of Costing Methods
- Time And Product Inventory
- 3 Year Product History In Units, Dollars, Cost, And Profits
- Automatic Forecast Of Product Sales
- Automatic Pricing Assignments
- Alert And Activity Reports With 11 Sorts
- CRT Shows On-Hand/On-Order/Committed/ Sales/Cost/Profit/Turns/GROI

Purchase Order

- Allows Up to 99 Lines Per Purchase Order
- Per Line Discount In %
- Purchase Order Accepts Generic Discounts/ Freight/Taxes/Insurance
- Purchase Order Accepts Back Orders & Returns
- Purchase Journal
- Automatic Interfacing With General Ledger, Payables, And Inventory

Billing

- Invoicing On Plain Or Pre-Printed Forms
- Prints Sales Journal
- Automatic Updating Of Committed Products In Inventory
- Ability To Customize Invoice for Remarks
- Allows Return Credit Memo
- Interfaces With Inventory, Accounts Receivable And General Ledger

Forecasting

- Unique program that automatically forecasts using your 3 year history
- Forecast Revenue And Expense Accounts
- Forecast Vendor Purchases
- Forecast Customer Sales, Cost, And Profit By Customer Or Salesperson
- Forecast Inventory Item Usage By 4 Automatic Methods
- Forecast By Same As Last Year, Or % Base From Last year, Or Trend, Or Least Square Trend Line Analysis Method

Minimum Hardware Requirements:
128K memory, one 5 ¼ DSDD floppy disk, 132 column printer, 80X24 CRT, MS-DOS, PC DOS 2.0 or later.

Runs on your: IBM (PCjr/PC/XT/AT), AT&T, EPSON, TANDY (1000/1200/2000), TI, COMPAQ, CORONA, SANYO, COLUMBIA, ETC.*

*(Computer names are tradenames and/or trademarks of their respective manufacturers)

Now Available in Northern California
To Order Call:

Free Software Improves CP/M Efficiency

By Robert D. Athey, Jr.

There are millions of CP/M devices in use today, thanks to Kaypro, Osborne, and others, and this constitutes a substantial and stable market, with plenty of active users and consumers of add-on devices and software of demonstrated utility. Despite all this, there has been a general tendency among computer publications to ignore the CP/M user, a fact which, as a 2+ year user of a Kaypro II, I find very frustrating. In writing this column, I regard it as my objective to be an empath to the CP/M user and to attempt to identify software and hardware worthy of investment. I would also like to pass along tips from other users.

Although we use our computers for a variety of reasons—e.g. operating a small business, writing for publication, or doing schoolwork—we have in common the need to use the operating system that controls the computer, to use the simple commands that tell us how much space we have on the disk, tell us what's on a particular disk, or copy material from one disk to another.

The original versions of CP/M had six main programs in their disk utility packages, including *DIR.COM*, *STATCOM*, and *PIP.COM*. These programs take up a fair amount of disk space (the latter two take up 14Kbytes), but through the good offices of people who donated their skill and time, alternatives were made available.

I find that the two most useful are the *SD-##.COM* and *NEWSWEEP* series of programs. Both have gone through multiple generations because of debugging and the addition of useful features; the *NEWSWEEP* versions are now so augmented with useful features that the program uses the same disk space as the old *PIP* and *STAT*, but now includes *ERA* and *REN* substitutes as well. You can usually get a copy of *NEWSWEEP* from your user group library or any number of remote bulletin boards.

The *NEWSWEEP* version currently available is version number 2.07. It usually comes with an excellent documentation file, often called "NEWSWEEP.DOC." Since *NEWSWEEP* has a relatively clearly set up menu, with code letters for each option and a word or two to describe each letter's function, it is easy to use. Program operation starts by typing in the name of the program in response to the "A+" prompt—in this case, the name of the program is "NWSWP207." The resulting display shows the author's name (Dave Rand), along with an itemization of the number of files on the disk, how many Kbytes they're using, and how many Kbytes are free. The next line shows the first program on the disk.

The "HELP" option is called up by simply typing in a question mark. The menu is set up alphabetically

The discussion of this program series in the PeopleTalk book on free software warns that hard disk machine users must be disciplined in their designations of program names with user areas (i.e., specify "B0" rather than "B"). The simpler multidisk machines do not require such rigor, however. (I am particularly impressed with PeopleTalk as publishers, as they don't use docu-gibberish. The periodicals, such as the user group newsletters and *Microcornucopia* or *User's Guide*, might be right on target for you, too.)

How useful is *NEWSWEEP*? You have to use it to appreciate how much better it is than the CP/M programs it replaces. Sure, some of the software command schemes are a little peculiar, but they become second nature after a while, and they are a lot less obtuse than the CP/M commands they replaced. There are help menus in the software, so use them frequently. There is documentation, and it pays to have it printed, so it will be close at hand (and use masking tape to put tabs on frequently used sections to reduce wear!)

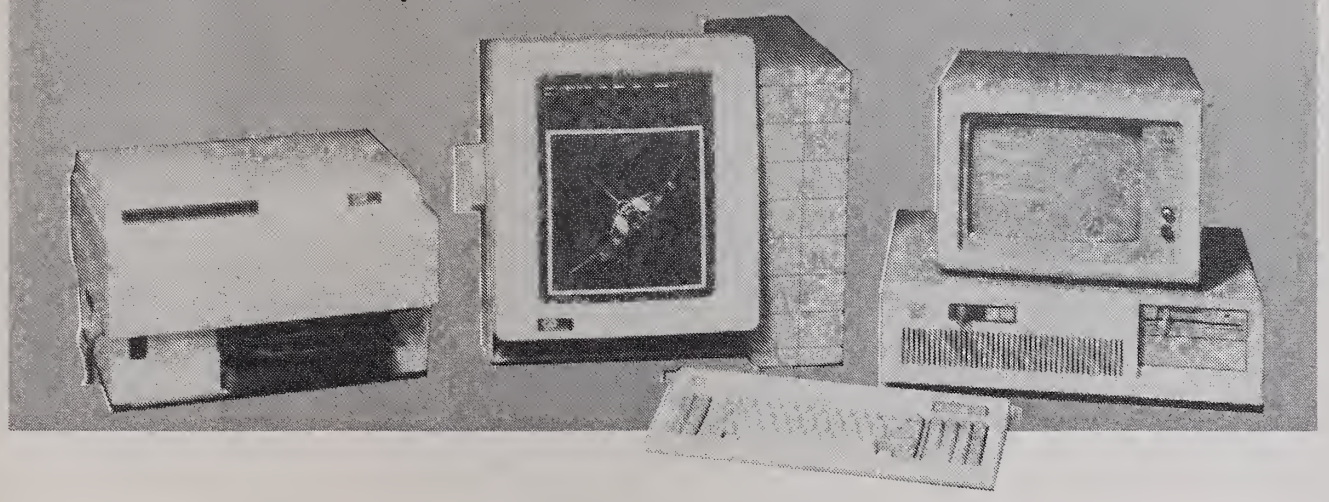
It would be difficult to over-emphasize the importance of user groups. There are three kinds of computer people, hardware nuts, software nuts (hackers), and users. I belong to the latter category, because of what the machine can do for me. You will find all three types at the user group meetings, and you'll find helpers and empathics from all three categories. Go to the local user's group meetings, as there is always someone there who's fought the same battle you did, and won it. It pays to trade success and failure tales with people of your own or slightly better skill levels, as it helps all involved. □

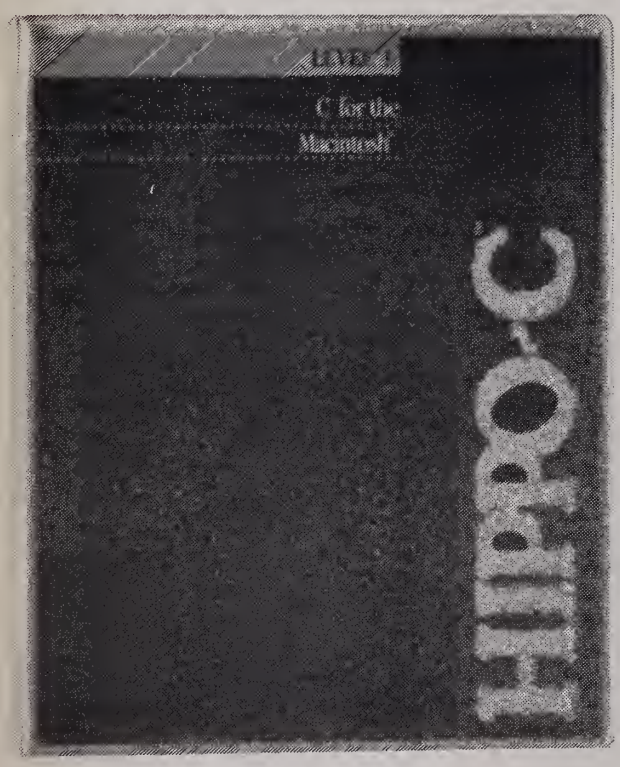
SYMBOL	MEANING
A	**"AGAIN,"** or repeat tag, after a tagging for a mass operation of some type, and doing the operation;
B	Move backward on the listing (A return will move the next line up);
C	**"COPY,"** which will query the disk drive onto which you want a copy. You can simply specify "B", or tell it "B:NEWNAME.NNN" to simultaneously move and rename (if you have a hard disk, use "B0");
D	**"DELETE,"** which will kill the file after an answer of "Y" to the confirmation query;
E	**"ERASE"** all tagged/untagged files (your choice by specifying at query);
F	**"FIND"** a particular file;
L	**"LOG** in New User area" to change disk drive being examined (a useful check on a transfer);
M	**"MASS COPY"** to move two or more files to a new disk or user area;
P	**"PRINT"** file where cursor lies. This gives an exact copy of the file with imbedded style or control characters (like ampersand commands in *Perfect Writer* files—a good check in format errors);
Q	**"SQUEEZE"** or **"UNSQUEEZE"**: The squeeze operation condenses the file up to about 40%, a real disk storage space saver. The squeezed file is stored on another disk, as designated by the user after query. This is especially useful in storing backup files!
R	**"RENAME"** file where cursor is positioned or tagged files (query on what OLDNAME and NEWNAME comes up);
S	**"SPACE"** remaining on current drive;
T	**"TAG"** which places an asterisk next to the file display and tells how many Kbytes are in the tagged file and total number of Kbytes tagged;
U	**"UNTAG"** file where cursor lies;
V	**"VIEW"** equivalent to the BASIC "TYPE" command as a CRT dump of file, a screen at a time;
W	**"WILDCARD,"** a quick way to tag a group of files, such as all files with "*.DOC" names;
X	**"EXIT"** to CP/M;
Y	**"SET STATUS"** of file: (can change R/O to R/W or the reverse with "R" command on query, or can use "S" command to make the file a system command—that does not appear on the directory). The latter is useful in replacing the standard CP/M commands like "REN.COM" and "ERA.COM" with the "NEWSWEEP" file;
?	**"HELP"** call up menu.

NEW PRODUCTS

Scientific Text and Graphics Packages For the PC

Corporate Data Systems of Santa Clara introduces products to enhance the effectiveness of the IBM-PC for technical and business writing. *VTEXT* is a text processing program which can generate italic copy for emphasis, enter formulae using scientific and Greek-alphabet characters along with conventional text, and insert lengthy mathematical equations; it also includes other useful word-processing features. *VDRAW* offers sophisticated graphics capabilities—up to 100 drawing layers, the ability to rotate, copy or crosshatch drawings, ZOOM and PAN commands, text generation in both ASCII and Calcomp fonts, and very high resolution. Both packages have been specifically designed for ease of use, with lots of menus and screen prompts. CDS also manufactures the CDS2300, described as "The Intelligent Graphics Laser Printer," with 300-dots-per-inch resolution and 8-page-per-minute printing speed. In Northern California contact Cypress Distributing Co., 1266 Lincoln Ave. #109, San Jose, CA 95125, (408) 297-9800 for information. Elsewhere, call CDS at (408) 980-9747 for a dealer in your area.



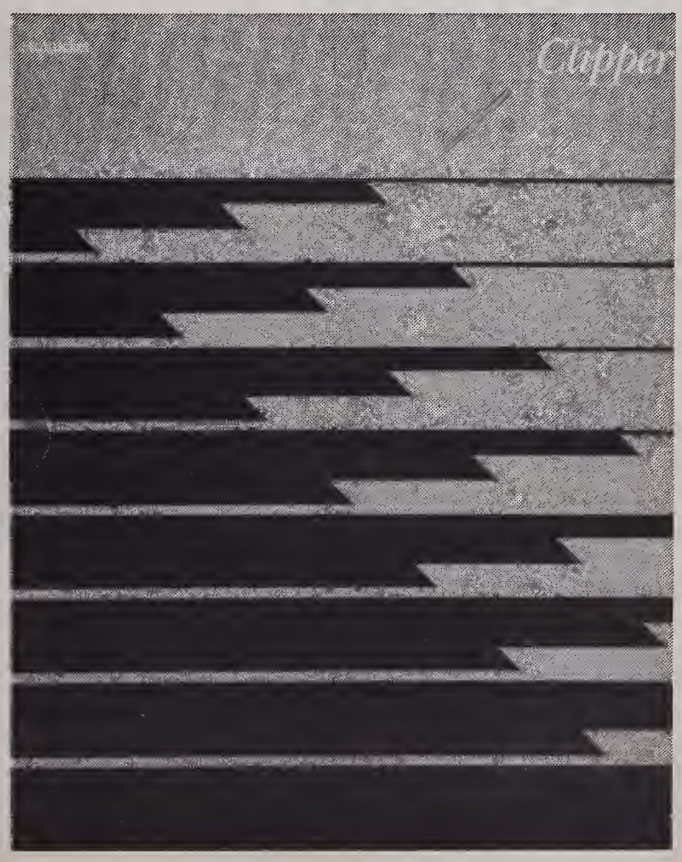


C For The Mac

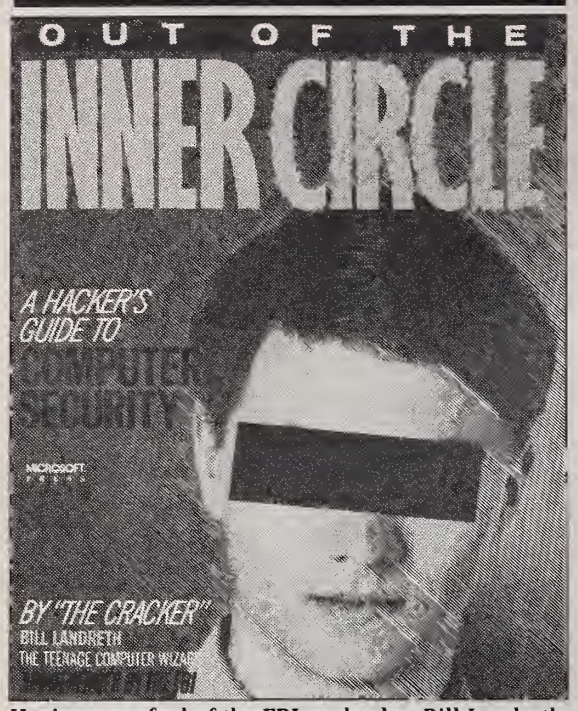
Hippopotamus Software has something for C language programmers who also love their Mac. *Hippo-C Level 1* allows quick, easy C programming on a 128K Macintosh and includes an editor, compiler, linker, C run-time library, online tutorial/manual and a shell command processor. *Level 2* is a more sophisticated package which runs on a 128K model but can also take advantage of 512K. It includes, in addition to *Level 1*'s features, an assembler and full floating point support, including math and trig functions. Hippopotamus Software, 985 University Ave., Suite 12, Los Gatos, CA 95030, (408) 395-3190.

Speed Up dBase III

If you like everything about *dBase III* except its speed, or lack thereof, take heart. *Clipper* is a compiler which greatly enhances the efficiency of *dBase III* on IBMs and compatibles. It allows the program to run at 2 – 20 times its usual speed, and also allows the user to run multiple copies of the *dBase III* source code, enhance the code's security, and use the same features and commands as the original *dBase III*. *Clipper* is manufactured by Nantucket Software; it retails for $695 and is available from Delta Information Systems, 150 Chestnut St., San Francisco, CA 94111, (415) 362-6663.



BOOKS



Having run afoul of the FBI, ex-hacker Bill Landreth relates his adventures and tells what you can do to keep his compatriots out of your system

Out Of The Inner Circle

A Hacker's Guide To Computer Security

By: *"The Cracker" Bill Landreth, with Howard Rheingold*
Published by: *Microsoft Press, Bellevue, WA*
List price: *$9.95*
Reviewed by: *Mike Markowitz*

The words on the cover call this a "Guide To Computer Security," but in fact Bill Landreth's new book is an account of a lost world: the brief moment in history when corporate mainframe computers and the telephone network were the playground of an elite underground of "hackers." Advances in the state of the art, and a growing obsession with computer security (symbolized by the regrettable movie *Wargames*) may soon lead to the extinction of the hacker, so we are lucky to have a chronicler who was so close to the action, and who writes so fluently.

"The only way in which I am really different from most people," he reflects, "is in my fascination with the ways and means of learning about computers that don't belong to me."

MicroTimes readers may recall our October, 1984 interview with 19-year-old Landreth, who lives with his family in Poway in San Diego county. On October 13, 1983 his computer equipment was seized by the FBI as evidence in an investigation of illegal use of the GTE Telemail system. Along with other members of the Inner Circle, a group of high-level hackers, he had used unauthorized administrative accounts on this network to create a private bulletin board system. The case and its happy outcome are described in an Epilogue. Most of the book, however, is written as advice to the system operator or management information system bureaucrat who needs to understand the hacker phenomenon. Of course, the novice hacker will find a wealth of ideas here for gaining access to unprotected or carelessly defended computers.

The book opens with a dramatic account of an electronic battle of wits between a skillful hacker and the system operators at "MegaCar International." Landreth recounts his own first steps in hacking—the discovery of the "magic door":

> I didn't acquire a dumb terminal because I wanted to break into big computers. In fact, the situation was exactly the reverse: A friend loaned me the terminal and in the process of finding out what to do with it, I discovered the world of minis and mainframes.

An historical flashback traces the origins of hacking to the first computer time-sharing systems at MIT, and the phone phreaks of the late '60s, such as the legendary Cap'n Crunch. A short, lucid chapter explains the basic concepts of an operating system, communications networks and levels of security. Several chapters explore the psychology and motivations of the hacker, and develop a typology of profiles: The Novice, who is 12 to 14 years old and just playing; The Student, driven by eagerness to explore a system in depth, who may feel that he can learn more in a day of marathon hacking than in an entire year of school; The Tourist, who loves the challenge of penetrating as many different systems as possible; The Crasher, who simply wants to make trouble by erasing data, scrambling files or bringing down a system; and finally, The Thief, a criminal motivated by personal gain. The Thief is not really a hacker at all, but the threat he poses to vital data may encourage paranoia about the more innocent activities of harmless hackers. Landreth describes a kind of ethical code, the Bushido of the true hacker Samurai: (1) never delete or damage information that belongs to a legitimate user, (2) never leave another hacker's name or phone number on a system, (3) never exist as a parasite on the finding of other hackers, but always strive to obtain and contribute fresh accounts and access information. The discussion of passwords, by itself, is well worth the price of the book. "The Cracker" was considered an expert in the arcane art of guessing the password. All too many accounts, he observes, are protected by trivial, obvious passwords like SECRET, LOVE and SEX, or the user's first name.

The technical aspects of penetrating a computer system are described in fascinating detail. For example, consider the tactic called "the decoy":

> When I left my original, low-level account open, I also left this program running. When the next call came into the system on my "open" phone line, my decoy program displayed for the caller all of the "hello, please log on" messages that the operating system would normally display. The difference was, my program stored the caller's account and password information in a special file I had set up in the host system.

Another tactic is the "Trojan horse," a file designed to attract the curiosity of other users who will want to access the program, just to find out what it does. When the victim runs the program, it displays some silly message, while unobtrusively reading the user's memory locations to steal his or her password, or perform some other high-security task.

A more advanced strategy involves "fooling" the computer into thinking the intruder's remote terminal is actually the system operator. If successful, this ploy gives the hacker the ability to assign passwords, create accounts, erase files, and even lock out the legitimate system operator.

The best hackers constantly try to "think like a user," so Landreth emphasizes that the system operator who wants to defend his computer from intrusion must learn to "think like a hacker." Since a clumsy or naive hacker will leave tracks, it is also important to educate users to be alert to signs of tampering, intrusion or mischief.

What makes a particular system attractive to hackers? Some key factors are: computers with many users, high-visibility corporations, friendly operators (many were hackers once themselves), and systems with extensive network connections.

Encryption devices, "callback" units, user logs, terminals with unique IDs, nonstandard modems, and similar techniques have been employed in the struggle against hackers. Like the classic race between armor thickness and gun caliber, each improvement in protection inspires greater efforts to defeat it. These security devices and their limitations are discussed in several chapters and a special Appendix that reviews specific products. Hardware alone, Landreth argues, will never ensure complete security until it is as intelligent as a determined hacker.

The final chapter is titled "What To Do With The Hacker You've Caught." The system operator who threatens or provokes the harmless hacker should not be surprised if the system suffers some terrible vengeance. "If you treat a high level hacker contemptuously, your underestimation of his ability could cost you dearly," he says. On the other hand, a rational and respectful approach is likely to recruit the hacker as an ally, or at least an honorable opponent. As a dedicated game player, Landreth suggests a strategy: identify the hacker, confront him, enlist his aid, neutralize his works and then remove him.

Microsoft Press produces handsome, well-made books. *Out Of The Inner Circle* is no exception; the margins are wide, the typography is attractive and the editing is clean. The heavy hand of the Lawyer, which grows more and more apparent in this industry every day, may be seen in the "disclaimer" which deserves to be quoted in full (from the flyleaf): "Microsoft Press has not undertaken a comprehensive investigation of the fact and representations of the author with regard to particular computer systems, operating systems or other products. Consequently, although it has no knowledge of any inaccuracies in the author's treatment of particular products, Microsoft Press makes no warranties or representations regarding their accuracy and disclaims all liability therefor."

Since Landreth casually discusses the sort of information that computer companies routinely treat with a degree of secrecy once reserved for H-bomb manufacturing instructions, this sort of weaseling is, perhaps, forgivable. I find it amusing.

One aspect of the Myth of the Computer in our collective consciousness is what we may call the "Mozart syndrome." This is the image of the precocious computer genius, the prodigy who sits before the terminal with intuitive childlike understanding and Godlike power. The copy on the book cover call Bill Landreth "The Teenage Computer Wizard." The bright side of this myth, of course, is the hope that youthful innocence will somehow redeem a demonic technology. The dark side of the myth is the expectation that these kids will burn themselves out, or mature into warped and inhuman techno-nerds. In *Out Of The Inner Circle* you will find a sane, human voice, sounding clear through the hype that has come to surround the entire subject of hacking. Anyone with the slightest interest in computers should buy it, read it and share it with friends.

BOOKS

The Educational Software Catalog

1985, 1st Edition

Distributed by: *Soft Kat Inc., Canoga Park, CA*
Available through local computer stores and software dealers
Reviewed by: *Mike Markowitz*

This is a beautifully organized and printed catalog that will be of great value to curriculum designers, teachers, parents and any personal computer users concerned with education. Hundreds of carefully chosen software packages are classified by subject and listed by publisher, with list prices, grade levels and short descriptions. Everything is color-coded according to type of computer. Apple tends to dominate the market, but there are extensive listings for Atari, Commodore and the IBM PC as well. Over sixty publishers have products in the catalog, some have only one product, others are giants with dozens of titles. For many programs, a small color photograph of a typical screen is included. This gives the reader some idea of what the program is like visually, but text is not always legible at such a small scale. A serious effort went into keeping this catalog up to date (it is issued several times a year); a number of items have "DISCONTINUED" printed across the entry in big letters.

Finding good educational software is a problem for many users. Few stores are able to stock more than a handful of titles, and publishers of specialized products cannot afford to advertise in the high-visibility journals. Evaluation before purchase is an even bigger problem. I could never master trigonometry, a hateful branch of mathematics that has important applications in electronics. I was curious to find out if any good tutorial programs on trig were available for the Apple. Using the catalog, it took only a few seconds to locate a $50 one-disk program, and a monster $275 six-disk package.

A reassuring note says that "every program in this catalog has been reviewed and recommended by our team of educational experts." In addition, many items carry the National Education Association "Teacher-Certified" seal of approval.

The intention of this 112-page, magazine-sized booklet is for the user to order through a local store or distributor (the copy I saw was picked up in a computer store in a large shopping mall), rather than direct from the publisher, or the wholesaler. Some full-page advertisements must have helped to defray the printing costs.

How much U.S. history and geography do you really remember? If you feel you can just sit and watch as a competent instructor for the kids while they are learning from this trivia-style game, you may be mildly surprised. Oh, I'm sure you remember the names and capitals of all 50 states as they flash on the colored monitor, but how about each state's major industry, largest non-capital city, and the date each became a state?

EDUCATIONAL SOFTWARE

If you are feeling a little less than confident now, why not join the kids in play and watch the computer score your answers? As the screen displays a map of the nation, one state will be flashing. One to four players may compete as each will be asked to correctly spell and enter the name of the state and answer some questions. If you answer correctly, you will be awarded points and the computer will emit a joyful tune; incorrect answers produce the proper response and a computer "booing" sound. In all sets of questions, you are first asked to name the state and then to choose your category question. The order of the states is changed each time you play.

The speed of play is player-controlled, and if you're still feeling incredibly confident, try the Flash Test and then opt for "fast." A word of warning, however: this calls for quick state recognition and the abilities of a speed typist.

The game is entertaining and educational. It offers correct answers to all missed questions or misspelled entries, and with repetition, players can't help but learn U.S. history and geography during the course of play.

American History

Becoming A World Power 1865 – 1912

Published by: *MicroLab, Highland Park, IL (1985)*
Version reviewed for Apple II series, other versions available
Reviewed by: *Mike Markowitz*

With some effort, it is possible to make American History boring. The story of a people drawn from the dregs of humanity, who subjugated an entire continent in only a few centuries and created astonishing works of literature, technology and social organization can actually be made so dull that students in a classroom will HATE hearing about it, even though it is their own heritage! *American History: Becoming A World Power 1865 – 1912* shows that this can even be done on an Apple computer, a device that normal kids usually cannot be kept away from.

Regrettably, MicroLab has taken one of American history's less scintillating chapters and made it downright boring

Understand that Reconstruction, Industrialization, The Closing Of The Frontier, The Rise Of The Cities and The Origins Of Imperialism do not add up to the most exciting period in our national saga. There was a succession of bland Republican presidents. The economic issues were complex (can anyone imagine getting worked up over the coinage of silver?). The takeover of Hawaii, the Philippine Insurrection and the intervention in Mexico do not exactly reflect credit on American foreign policy. But a good teacher, with a bit of academic freedom, a good textbook and a few good films, can teach this period in a way that will keep those high school students on the edge of their seats, even in the last period of the day. This software package from Micro Learn will not help. It is a classic example of an electronic page-turner.

I cannot believe how slowly it runs. It goes back and churns the disk drive after every frame. The programmer ignored even the simplest tricks that would speed up the user interface. For example, you must input a number and also hit the enter key every time. It should be sufficient to just make one keystroke.

The blocks of text are too long. The text itself is deliberately watered down to avoid any sort of controversy. This is deadly to the serious teaching of American history. While there are no obvious errors of fact or omission in the text, there are so many bland generalizations, and so few sparkling nuggets of human interest, that even the most highly motivated student will have to struggle to keep plugging away at screen after screen of "tutorial."

A typewritten 25-page manual provides clear instructions, supplementary materials, and a list of Behavioral Objectives. Teachers are taught to value Behavioral Objectives in education courses. Good teachers forget about them whenever they interfere with the excitement of learning.

This product cannot be recommended. It will probably be successful with those school districts where the primary software acquisition guideline is that nothing may resemble a game, or be fun.

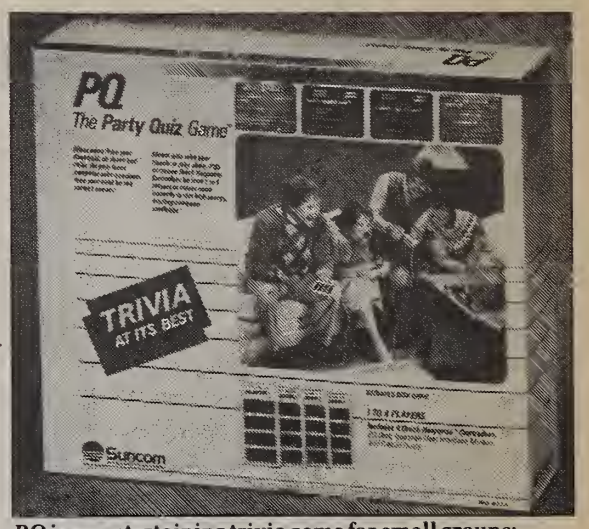
GAME SOFTWARE

PQ: The Party Quiz Game

Published by: Suncom, Inc.
For: *Apple, Atari and Commodore*
Reviewed by: *Pat Hamilton*

Trivia games were hot sellers in 1984 and it appears the market is still ripe in 1985, as all types of trivia computer games continue to flood the stores. *PQ: The Party Quiz Game* is somewhat different from most, as it allows up to four players to sit back from the terminal, each armed with his or her own controller, and vie for the fastest correct response to the question on the screen.

The questions which appear on the screen are short, easy to read, and aimed at the baby boomers. They can be multiple choice and answered by pressing buttons "1, 2, 3," or "4," or may be True/False questions which can be answered by depressing "1" for a true answer and "2" for a false. An experienced player can be handicapped by so indicating, which will allow him half the response time the others have. His controller will be inactive during the first half of the allotted



***PQ* is an entertaining trivia game for small groups; however, guesswork may be just as useful as knowledge while playing**

time allowed for answering. The response time can be preset by the group.

A timer bar at the bottom of the screen starts running as soon as the question appears on the screen, and then becomes locked out. Each player is allowed only one answer per question. If the answer is correct, the clock stops, a "happy" tune plays, and the first player who answered correctly is awarded points. If playing in the competition mode, as soon as a correct answer is entered by one player, all other players are locked out. If playing in the social mode, each player is allowed to enter one answer until time runs out. This is where you take your time and really read the questions.

After each two rounds, a Report Card is displayed on the screen showing each player's score along with a comment (not always too encouraging) on his or her progress or lack thereof. This short intermission is accompanied by music — which may be turned off on request. Rounds 4, 7, 11, 15 and 19 are Lightning Bonus Rounds. The computer randomly selects a player who is given 20 seconds to answer up to ten questions. All players have a turn at the Lightning Bonus Round. Naturally, the object of the bonus round is to correctly answer as many questions as possible in the least amount of time.

The game is fun for small groups; however, you should know that there are some potential problems. After any extended amount of play, the questions begin to reappear. Secondly, due to the inclusion of so many True/False questions with a 50/50 successful answer ratio, a player may be tempted to depress button "1" or "2" as soon as the question appears on the screen. Since points are awarded on a rapid answer timing schedule, a player can accumulate massive points by never reading the question, but just playing the odds. We experimented with a group of four players; one player never read the questions but merely depressed the "1" key as soon as the question appeared on the screen. On every question, he had a 25% chance and on every True/False question a 50% chance of answering correctly. The other players attempted to read and answer the questions correctly. The player who never read a single question scored as high as the other three, because when his answer *was* right, he was awarded massive points for answering so quickly. Either that, or the other three were just poor at recalling trivia! However, if the computer catches you holding a button down on your controller at the time a question appears on the screen or trying to jump the gun, you will be labeled "CHEAT" and your controller will be disabled for the duration of that question.

GAME SOFTWARE

Murder By The Dozen

Published by: *CBS Software*
For: *Apple Macintosh*
Price: *$44.95*
Reviewed by: *Pat Hamilton*

All you Agatha Christie and Robert Ludlum fans, take heed, for murder is the name of this game. Something is rotten in the city of Micropolis. Folks have been turning up dead in the strangest places and under the oddest sets of circumstances. The city houses 28 locations, such as apartment buildings, doctors' offices, parks, and, of course, the local pub, and you may begin your investigation in any location. You are the top homicide detective on the force, and it is up to you to determine who has been committing these heinous crimes and why.

The game can be played by one to four players. Each of the 12 games starts with a case history of known facts about the deceased and the set of circumstances regarding the murder. This case history can be read by all players as it appears on the screen. Cases include such infamous murderers as Wally Snark, suspected drug dealer; Adrienne Bishop, high fashion model; and Lisa Fenton, runaway housewife. To win you must identify the murderer and explain the motive. You may also be asked to produce one or more pieces of physical evidence to support your case.

Players are advised to follow numerically through the case histories and games starting with number one, as each case becomes more detailed and more difficult. At the beginning of each game, the detective(s) will be offered a choice of seven courses of action. You choices include interviewing local townfolk, examining rooms, checking security systems, or examining files, fingerprints, photographs, etc. Each activity automatically clocks up a predetermined amount of time—questioning people usually does not account for much time, but examining rooms and files, although invaluable, can be very time-consuming.

Numerically coded answers to your queries (clues) appear on the screen. Every time a clue is offered, three minutes are added to your running timeclock and you are sent to the "Clue Book" to retrieve your answers. Since there is only one "Clue Book" provided, opponents must either leave the room or else benefit from what is discovered and shown on the screen. This mass exodus of players tends to undermine the competitive spirit of the game. Since keeping good notes is vital to survival, the game may lag as a player looks up five clues and carefully notes them for future use.

My advice for new players would be:

1. Play the games as listed in sequence;
2. Plan your trail carefully and don't waste time;
3. Interview only those people you *must* interview;
4. Remember to utilize all the resources available at the local police station;
5. Keep good notes.

While in the police station, you will be able to run a computer search through records, check fingerprints and photographs, and gain all sorts of other information. The game can be enjoyed by all players at almost any age level and mystery buffs will particularly appreciate it.

There are some built-in nuances to the game. Although detectives may travel around town interviewing and searching, players never see any movement on the screen. The entire game consists of an aerial view of Micropolis, which becomes boring after a while. I'm still not sure why the "Clue Book" exists as part of this game. Why the designers didn't just list the clues on the screen instead of enumerating them in a book is still a mystery to me.

In addition to the "Clue Book" the game has a "Solutions Book" which can be consulted only by the detective attempting to solve the case. The book can be read only by covering the answer page with a piece of "magic" red plastic. Upon completion of the game, when one player has decided to consult the "Solutions Book," he or she must have completed all the criteria; that is, name the murderer and all the facts and circumstances surrounding the case. At this point, if all has been solved correctly, the sleuth will be rated on his or her ability and the amount of time taken to solve the case. You may become known throughout Micropolis by such demeaning titles as "Bumbling Detective" or "Befuddled Detective" or the sought-after titles of "Professional" or "First Rate Detective."

Being a mystery buff myself, I enjoyed the game. My only complaint is that it really doesn't utilize the computer and probably could have been just as exciting as a board game . . .cheaper too!

NEW! MERGE/ PRINT

Complete Word Processing: ONLY $10

(Yes, We Said **TEN** Dollars!)

PC-Write™: Fast, Friendly, Flexible

PC-Write is a trademark of Quicksoft™ (For IBM PC, PC/XT, PC/AT, PC/jr, and true Compatibles) Wordstar and MailMerge are registered trademarks of MicroPro Int.

Professional Features
- Complete set of word processing features.
- Also excellent for editing program text.
- DOS **standard files** use any ASCII codes.
- MERGE/PRINT and. . . . ***FOOTNOTES!***
- Run DOS with editor and file in memory.
- Customize to foreign character sets.
- Supports 50+ printers, or can customize.

Easy to Learn
- Tutorial in manual gets you started.
- Nine screens of **Help** if you get stuck.
- Type anywhere on screen; **no boundaries.**
- Backup, save, un-delete keys avoid loss.
- Keyboard is easy to learn, easy to use
- Fonts like **bold** and ***underline*** on screen.
- Works on PCjr and single disk systems.

A Pleasure to use
- **Fast editing** avoids distracting waits.
- Fast startup, save text to disk, exit.
- **Customize** your keyboard anyway you like.
- Record and playback repetitive sequences.
- Customize your screen colors and fonts.
- Split screen can **edit two files** at once.
- Transpose, change case, bookmark keys.

NOW! MERGE-PRINTING!

The Best Just Got Better! PC-WRITE now can **Merge-Print** - like MailMerg® ! The latest version has other new features. But the same low-low price. And **ProActive**'s exclusive program to convert **WordStar®** Files to standard ASCII (for **PC-Write** or other uses)

"**PC-Write** is packed with intelligent, useful Features. . .(it) may well be more versatile than WordStar — it's certainly more straight forward."

—PC World
Nov. 1984

MAKE NO MISTAKE: **$10** buys NOT a "demo disk" or a watered-down version, but the complete program, in all its speed and power! No gimmicks, no catches. No kidding!

Order ***PC-Write*** NOW! Only $10.00*, from
ProActive Systems/MT
POB 20179
Oakland, Ca 94620
*plus $1.00 shipping; California residents, please add $.65

SWEET SAVAGE BYTE

The Beat Is On

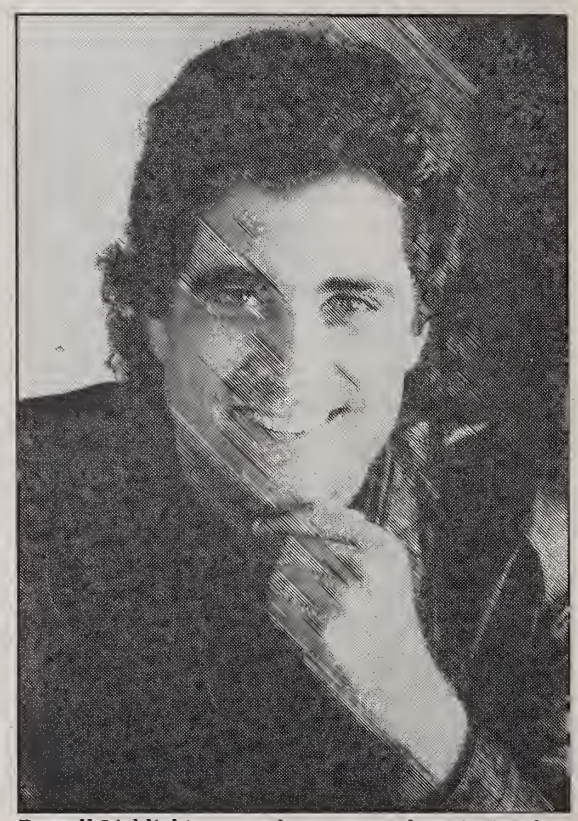
Russell Lieblich programmed *Web Dimension* and collaborated on *Master Of The Lamps* for Activision. Shortly thereafter, he visited picturesque Hollywood, California for an interview with Jina Bacarr. The rest — well, read for yourself...

By Jina Bacarr

Hollywood Boulevard is a dirty street in a dirty town, the master gamesman decided. He crushed the butt of his half-smoked cigarette with the heel of his shoe into the flesh-colored star of a blonde goddess long since gone to her Olympus. But L.A. *had* been home for a long time, Russell remembered, long before the pine sweet air of Northern California had tantalized his nostrils with an incense he couldn't ignore. And now he had been forced to return. And for what? To meet up with some lady reporter from a computer magazine whose reputation had earned her a monthly column, named of all untechnical things, Sweet Savage Byte. My God, life had been tough enough in the reckless lane of L.A. perfunctory interviews, but this one was going to be unbearable.

As Russell and his business associate entered the last bastion of the Hollywood Boulevard commercial center, he noted the talent walking the streets. They hadn't changed since the days *he* was a young musician playing the clubs with a couple of college degrees burning through his hip pocket. Most of these musicians were between gigs, or waiting for a break in that new club on the Strip. Russell breathed in the foul air with a new sense of pride. Those days were behind him now. He had made his own breaks and created a world that hadn't existed when he was a kid growing up on the streets of New York, a baseball in one hand and a guitar in the other. Music had remained his first passion. Music—the soaring notes, the beat in his bones, the mental beauty he experienced when the treble and bass exploded into new and exciting sounds and tantalized his soul with powerful emotions. The twenty pieces of music he had written for his games exemplified that excitement. He'd make sure Miss What's-her-name knew he wasn't just some psychedelic rocker with the beat in his eyeballs. Music was his life! He was also working on a romantic symphony marrying his love of classical and electronic music. And hadn't his two new pieces of software, *Master of the Lamps* and *Web Dimension*, been called revolutionary visual and audio artistic expressions in game software? From the haunting whispers of music on his evolutionary web to the hypnotic space music of his three dimensional magic carpet, Russell's objective was to open up a new experience for the player that would not only challenge his mind, but also reward his aesthetic sense with the thrill of music.

But the road hadn't been easy. After years of playing in piano bars, Russell kept experimenting with computer graphics and sound. Finally, he was able to design software (working with Peter Kaminsky on *Master of the Lamps*) that rewarded the player with spectacular visual graphics and audio excitement. He never dreamed when he was studying for his B.A. at the University in New York that his love of music would enhance his curiosity about physics to produce audio/visual software in this new age of computerized entertainment. Let Miss Sweet Savage Byte put *that* in her bubble bath!



Russell Lieblich's past adventures pale to insignificance in comparison to his encounter with MicroTimes' *femme fatale* in residence, Jina Bacarr...

"Well, this is the place," Russell said in his slightly nasal accent. His words came fast, almost clipped at times, but more than one dewy-eyed female had sighed over the deep resonance of his voice. He opened the office door, wondering what kind of questions this high tech Lois Lane would ask.

"Yeah, whaddaya want?" a squeaky falsetto greeted him from the front desk as they walked in. Russell cringed as the stiletto-haired blonde looked him up and down as if he were a piece of hamburger ready for the grill. He returned the favor. In her black mini and brass-bullet buttoned vest, the receptionist looked like a three-dimensional Red Sonja looking for her Conan.

Her pink neon lips curved into an interested smile as the blonde punk goddess ushered him towards another office to meet the Queen of Computer Columns in person. As he walked down the hallway, Russell noticed glossies of Billy Idol scowling at a cutesy grinning Cyndi Lauper poster on the wall. He wondered what he was getting himself into: Nerd Wave? or maybe Heavy Modem?

"Hi, Russell, my name is ..." her voice tuned sweetly into his ear as he walked into the room. This was the infamous Brenda Starr of the computer tabloids? The redhead who took on the entire Pig Sty? He hadn't expected this. Nervously, he reached for another cigarette while he appraised her appearance. Her green eyes sparkled, then flirted as she asked him if he would explain the games and their objectives. Quickly, he ran through the different tactics and strategies of the games, figuring that if he drew her a map of the freeways she'd probably think it was a game of tic tac toe. He *did*, however, notice her soft, plain green dress and the delicate antique lace fichu around her shoulders. He lit his cigarette and took a couple of smokes while he caught his breath. What had he let himself for? No computer reporter looked like she had just stepped out of the 1900 Paris Exposition. Worse yet, he could imagine what kind of a story she would write—that is, *if* she could write.

"What kind of music did you compose for your software?" she asked with a smile and turned on her tape recorder. The sweetness in her voice was still there, but Russell knew that look in her eyes. Another determined female. Russell bit his lip and the taste of stale tobacco on his tongue made him grimace. No use kidding himself. This was going to be another gruelling interview after all. And recorded yet. Damned machines always made him uneasy. As he answered her questions, Russell felt the words coming fast and with more abruptness than usual. Formal and businesslike, he went through his spiel. He'd show this lady reporter with the allure of a comic book heroine and the tactics of Sam Spade she wasn't fooling him one bit.

"Baroque, jazz—and of course, rock," Russell finished. Why had he felt compelled to let her know he wasn't just some four-eyed computer hacker who never looked beyond his computer screen for visual delight? "It's sort of like a home computer *Fantasia*," he finished and looked around for a receptacle to dump his half smoked cigarette. As the redheaded columnist handed him an empty styrofoam cup still reeking with the smell of office coffee, he noticed the elegance of her fingers and the light sparkle of her pink nails. These fingers pounded away at a keyboard? he questioned. He was beginning to wonder if she really did write the column, or was she strictly a front for some wily old hack with a cigar behind his ear used to covering the tabloid beat? Well, she did seem to have a spark of intelligence. Maybe she would do him justice. Let the people know that Russell Lieblich was a man with a dream—and years of hard work behind him. How could he tell her he yearned to write the music that would lead players right into the twenty-first century with the drama of the classics and exquisite technical percussions never heard before? His software games were the first step in that dream.

Russell decided to tell her his story. This was going to be an afternoon well spent after all.

Sometime later, Russell again found himself staring at the cement stars on Hollywood Boulevard where many a dream had crashed. He knew now he wouldn't be among them. It was still a dirty town, but he had beaten it. His star was rising fast and the little lady from the computer mag just might make it shine a little brighter. He pulled out a fresh cigarette from his new pack. Why not take in some old sights while he was here? The club where he used to play, the all night market, his old digs ...

Russell Lieblich walked slowly along the gaudy boulevard of forgotten dreams and lit up his cigarette. He wasn't in a hurry to leave anymore. He had some unfinished business first. A date with his past — and a rendezvous with his future. It felt good to be home ... if only for a little while. □

USER GROUP NETWORK

By Mary Eisenhart

Our own **Mike Markowitz** has some good news for owners of **Franklin** computers. While Franklin itself is still moribund in the wake of its legal hassles, Franklin users are nothing of the kind. There is now a national Franklin Users Group, which will offer a public domain software library and hopes to start an on-line BBS as well. Also in the works is a newsletter for group members, and the ever-enterprising Markowitz observes that the group "even threatens to pay a nominal fee to newsletter contributors." So, all you frustrated Franklin owners out there, this is your chance to pool resources with others of your kind. Contact the Franklin Users Group at East Wind Road, Apt. L, Tecumseh, MO 65760.

From the farthest reaches of New York comes a letter from **Jeffry Luria,** who's the president of the **MicroPro Users Group of America.** Luria says, "We are located in New York, but are a national group with over two hundred members from various states as well as other countries." Members live as far away as Japan, Venezuela, and Israel. The group is dedicated to supporting the entire MicroPro line, but places special emphasis on *WordStar* and *InfoStar*. Users of all types of hardware are welcome. The group publishes a monthly journal called *OmniStar*, and may be reached c/o Procyn Associates, 140 Riverside Drive, New York, NY 10024. Should you be inclined to contact fellow MicroPro enthusiasts by phone, the group's phone number is (212) 595-4811.

The **San Francisco First Osborne Group** has been going through a few changes, and announces its reorganization as a multi-computer user group for owners and users of all types of portable computers and users of the CP/M operating system. In addition to maintaining its relationship with the national First Osborne Group, the group has affiliated with the Kaypro Corporation User Group Department as a member KUG, and is seeking to establish relations with manufacturers and vendors of other CP/M based products. The new organization, now known as the **San Francisco Computer Society,** meets at St. Aidan's Church, Diamond Heights Blvd. at Goldmine Drive in San Francisco, on the fourth Thursday of each month starting at 7 pm. All are invited, and annual dues are just $10.00. The Society's new mailing address is P.O. Box 783, San Francisco, CA 94101-0783. Please direct all inquiries to this address.

Eugene C. Dinovo of Sepulveda has a slightly unusual users group for the **Tomy Tutor** computer. You may remember Tomy as the Japanese toy company that brought you such gems as Mr. Mouth and the Air Jammer car series, but they have their high-tech side, as Dinovo reports: "The Tomy Tutor computer is a children's 16-bit computer with built-in BASIC and GBASIC. We feel that it is the easiest computer on which to perform actual animation using GBASIC. The members are enjoying it immensely and would like to reach as many owners as we can." You're never too old to play, so contact Eugene at P.O. Box 37, Sepulveda, CA 91343.

All you FORTHians out there, **Linda Kahn** of the **FORTH Interest Group** has some news for you. First of all, FIG has devised a plan, underwritten by Mutual of New York, to offer members low cost group health insurance. FIG membership is $20.00 per year in the U.S., and members of this global organization also have access to product discounts, group life insurance, an on-line data base, a job registry, FORTH literature, and an ever-increasing array of other services. Not only that, FIG will be holding its seventh national convention, to be held this September 21 – 22 in Palo Alto. Start planning now. Contact Linda at (213) 478-7398 for more information, or contact the main FIG organization at (408) 277-0668, P.O. Box 8231, San Jose, CA 95155.

C-TUG (a.k.a. the **Commodore Technical Users Group**) sends along its highly informative newsletter, *Syntax Error*. These genial folks would like to remind you that they have *two* BBSs for members, C-TUG at (714) 636-1908 and GRAPEVINE at (714) 974-4284. The club meets the fourth Sunday of the month from 10 am to 1 pm at Mercury Savings and Loan, 1095 Irvine Blvd., Tustin, CA. Should you wish more information about this organization, please contact C-TUG at P.O. Box 1497, Costa Mesa, CA 92628. The club also held an *Archon* tournament last month — no word yet as to the winners.

Paula Martin of the **South Bay Kaypro Users Group** reports that the group is just getting settled in at its new meeting site, the Cupertino Public Library. Like many groups in the South Bay, the KUG has been in an unsettled state since Dysan, which seems to have opened up its auditorium to every users group in town, sold the building. No longer homeless, the group held its first meeting in the new quarters June 3. Paula reports that for the next couple of months the meeting schedule is likely to be a bit uncertain, and she recommends that you call **Chuck Hansen** at (408) 257-5244 or P.O. Box 390088, Mountain View 94039-0088 to find out when the next meeting will be held. She also reports that the group has just acquired a 200-diskette public domain software library from SIG/M, so that might pique your interest some more.

And South Bay **Kaypro** users who feel like they might profit from some training classes might want to contact **Bob Balan** of Computer Insights in Fremont. CI is offering classes on beginning, intermediate, and advanced levels in its Kaypro Computer School; topics range from *WordStar* and *dBase* to Intro to Computers. Call Bob at (415) 490-0685 for more information.

Budding showbiz types may be interested in the upcoming **ShowBiz Expo '85,** which will take place June 27 – 29 at the Santa Monica Civic Auditorium. The Expo will showcase products and ideas from the business and computer world for the TV, film, and music industries. This information comes to us from **Bunnie Strassner,** who just happens to be the wife of **Norman Strassner,** a.k.a. **Videoman,** who appeared in our March BBS article. Among other attractions, the Expo will feature a keynote speech by author **Michael Crichton** and conferences on topics ranging from "Financial Statements: What Every Creative Person Should Know" to "Spectrum of Computer Graphics in Entertainment." Contact Bunnie at (213) 668-1811 for more information.

The ***ENABLE* Users Group** held its first meeting in San Francisco on June 4; *ENABLE* representative **Cheryl Hazen** spoke about Version 1.1, due out shortly. The group is trying to set up a regular schedule of monthly meetings, and hardworking founder **Lion Goodman** heartily invites prospective members to contact him at 38 Glen Drive in Mill Valley (94941) or call him at (415) 383-2337.

The dauntless **MicroTimes Roving Speaker Squad,** or a reasonable facsimile thereof, will be stopping off at the **BAKUP Kaypro User Group** meeting on June 18. Full report next month. We *like* going and talking to user groups, although sometimes it's a problem juggling the dates and deadlines involved, so if you're a Bay Area group in search of free magazines and occasionally witty repartee for your meetings, let me know and we'll try to work something out.

Send this and all other relevant information (when you're holding your group's summer picnic, Disneyland trip, Scenic Tour of Silicon Valley, or other events) here to Mary Eisenhart, MicroTimes, 5951 Canning St., Oakland, CA 94609. □

BULLETIN BOARDS

NORTHERN CALIF.

Kayfog RBBS & RCP/M (Fog System 11) (415) 285-2687; Free; special help for newcomers, Kaypro, Morrow, Osborne, and CP/M.

OSBORNE™

SALES AND SERVICE

MISSION PEAK SYSTEMS, INC. is a fully Authorized Dealer for Osborne Computer Corporation, but that is only the begining of our story. Mission Peak Systems, Inc. has been repairing Osborne products at a reasonable price with a speedy turn around for over three years! That's right, Mission Peak Systems, Inc. is staffed completely with ex-Osborne Field Service employees who have been repairing and servicing Osborne's for three years. The employees of Mission Peak Systems know more about Osbornes and Osborne related products than anyone in the world! This is not the end of our story. We have established a network of Osborne dealers and service depots nationwide that will repair your Osborne, under warranty if purchased from Mission Peak, so you can travel with out fear of a breakdown.

Besides service and repair we offer:

- Osborne 1 and Executive computer, new and used, with a 90-day warranty
- Upgrades, (80 column, double density, hard disks, ram disks, etc.)
- Accessories, (cables, modems, software, etc.)
- Extended warranties (90 day and 12 months; subject to prior inspection)

OUR STORY IS NEVER ENDING!

MICROTIMES CLASSIFIEDS ARE AT YOUR SERVICE

To Place A Classified Ad

Free Ads: Private individuals may have one free classified ad of 15 words or less; additional words are 50¢ per word. A phone number, including area code, counts as one word. If you want your ad to run more than once, all subsequent printings will be charged at one half business rates.

Business Ads: Rates are $15 for 15 words or less, 50¢ for each additional word. Again, your phone number counts as one word.

Display Classifieds: Classified ads requiring special treatment (hairlines, all caps, boldface, centering, etc.,) are considered display classified ads. Call Chuck Stanley at (415) 652-3810 or Jeff Rosenfield at (213) 467-7878 for further information.

DEADLINE for classified ads is the 20th of the month *preceding* the issue date (i.e. deadline for the July issue is June 20). Type your ad or print it legibly, using this coupon or a separate piece of paper. BE SURE TO INCLUDE YOUR ADDRESS AND PHONE NUMBER SO WE CAN CONTACT YOU IF NECESSARY. Specify the category you want your ad to run under, and send it with your payment (check, money order, or VISA/MC) to MicroTimes Classifieds, 5951 Canning St., Oakland, CA 94609.

Categories: Hardware For Sale, Software For Sale, Wanted, Personal, Services, Equipment, Will Trade, Video, Employment Offered, Employment Wanted.

ARE AT YOUR SERVICE

For a mere fraction of your paycheck — buy, sell, trade, whatever. Just $15 for the first 15 words plus 50 cents for each additional word, per issue.

South Bay Software

Box 969
Millbrae, CA 94030
(415) 579-5455

Jack Johnson, who established South Bay Software at his home in Millbrae two years ago, wants it known that his operation is currently looking for dealers. "We would definitely welcome more dealers and retailers right now," Johnson says.

Actually, things have continually been looking up for South Bay Software over the last year. During that time, Johnson gained a partner in Marnie O'Connor, and has geared the business towards dealing strictly in Macintosh products. As Johnson puts it, "Originally, we had started out selling musical software for Radio Shack's TRS-80 computer until the market for it flattened out — then along came Macintosh."

On field-testing the Mouse Pad, Johnson says, "I drove my car over it several times and it came out okay. We even put them in the oven on high heat to see if they would melt."

South Bay Software's change of heart must have pleased Apple. Johnson says the makers of the Macintosh have assisted South Bay Software in getting a good line of credit and have also helped put the company's product line in with their dealers. "Business has also grown very steadily," says Johnson, "thanks to the increasing popularity of the Mouse Pad, which was featured last February at the *Macworld* Expo."

Johnson gives a slightly tongue-in-cheek description of the Mouse Pad: "It's designed to provide a clean working space for any Apple Mouse; it's great for armchair applications, as it allows you to lay-back and put it in your lap. It's also color coordinated with the Macintosh and it fits nicely into the computer's carrying case."

Johnson continues, "Another great feature about the Mouse Pad is that it will never have to be updated — it will always be the same for any Apple mouse. The pad is made up of closed-cell foam so it won't absorb liquids, and it is washable. All the other pads are made out of a fabric-type material, so they tend to wear out, whereas the Mouse Pad is extremely durable."

Johnson proved just how durable the Mouse Pads are by subjecting them to heat and impact tests. "I drove my car over it several times and it came out okay. We even put the pads in the oven on high heat to see if they would melt." He adds jokingly, "I'll tell you one thing—the pads sure don't taste very good."

In a more serious vein, Johnson states, "The Mouse Pad was well-received at the Macworld Expo, and has been critically acclaimed not only by various end-user groups but also by San Francisco's mayor, Dianne Feinstein. More important, though, is the fact that our retailers are selling out of them and re-purchasing more."

In addition to the Mouse Pad, South Bay Software features one other product, the Music Character Set. The software program could be described as a music word processor, strictly for writing sheet music and lyrics. The system's main purpose is to enable songwriters and musical directors to print out attractive sheet music without constantly having to re-write new sheets when making changes.

It comes as no surprise that South Bay Software offers this unique musical software package, since Johnson is a former musician himself. In the mid-'70s he played guitar and wrote songs for a Houston-based band called Nevasota, which released two albums. Johnson then moved to Los Angeles and worked with recording artists like Joe Cocker and the Pointer Sisters. His musical talents can be heard in the Bay Area on San Francisco's radio station KFOG during weekday mornings. Their "singing in the shower" program is preceded daily by Johnson's song, "KFOG On My Radio."

In 1978, Johnson went from penning songs to writing computer programs: "I wrote earthquake designs to help architects in the construction of hospitals and schools." This experience eventually led to writing his own designs for South Bay Software.

Currently, Johnson is working on two new graphic software packages which are similar to the Music Character Set but designed for engineers and architects. He hopes to unveil them by this summer.

As for any dealers that Johnson hopes to gain, he emphasizes, "We're competitively priced; the Mouse Pad goes for $12.95 and the Music Character Set is $24.95. Our soon-to-be-released packages will be priced at $19.95 and we offer a money-back guarantee. Plus, we service what we sell." What more could you ask for?

Cypress Distributing Company

560 Lincoln Avenue
San Jose, California 95126
(408) 297-9800
7131 Owensmouth #D14
Canoga Park, California 91303
(213) 621-2201

Compared to other computer product distributors, Cypress Distributing breaks away from the norm by providing their dealers with sell-through and profits. Says David Law, president of Cypress, "Most of the regional distributors, and the national ones to a lesser degree, supplement their dealers with all the expected things like technical support for hardware and software, wholesale seminars, and training sales people. Cypress does all of that too, but we really feel our job is to help our clients make money."

"Cypress does all the expected things — technical support, seminars, and training sales people — but we really feel our job is to help our clients make money."

Law explaines that providing sales and profits for their dealers is achieved through co-op advertising and promotions. "This, in turn, produces floor-traffic for our customers," he said. "Most regional distributors don't understand this concept. As a result, I feel Cypress is probably the best at supporting the retail store of any distributor in Northern California."

According to Law, Cypress runs about two to four promos a month, and the feedback they receive from their dealers is extremely positive. "We have customers that tell us they want to be in every one of our promotions," he says.

Apparently, their method of helping push products for the dealers has also had a beneficial effect on the company itself. Law points out, "Last year was Cypress' second year in business and we did 169 percent of our first year totals. We're a highly profitable company; our volume is in excess of six million dollars a year."

Law first had the idea to form Cypress around three years ago when he was working as a consultant for another distributing firm. "I could tell then that there was a definite need for a strong distributor that would help support the retailer," he said.

Although Law had no past experience distributing computer products, that didn't stop his foray into the market. "I had been marketing consumer products for twenty years, so all I did was take my knowledge about selling consumer merchandise and put it into the selling of computer products."

Cypress' long list of accounts, between 700 and 800, can attest that Law's transition from consumer to computer products has been relatively smooth. There are fourteen lines of products that Cypress carries consisting mainly of computer printers and microcomputers. They feature printers by Juki, Legend, Toshiba, Daisywriter, NEC, and Panasonic. Among their stock of microcomputers are Columbia Data, which is compatible with IBM software, and a line of Sanyo business systems.

Though Cypress does most of its distributing from its San Jose outlet, it also has a warehouse near Los Angeles at Canoga Park. "The place in Canoga is actually a sales office," says Law. "It doesn't have as many computer products to distribute as the San Jose warehouse does but it can receive shipments from them."

As successful as Cypress has been, Law does not expect the company to expand in the near future. He said, "I don't think 1985 is the year we're going to make a move because the market has been in a total state of flux. The way I look at it is that we've been doing quite well so far, so why risk anything?"

Text Sciences

2716 Ocean Park Blvd.
Santa Monica, CA 90405
(213) 452-9114

It would be difficult to find another corporation across the country that is more efficient and innovative at information processing, in one form or another, than Text Sciences in Santa Monica, California.

Maybe it's because Text Sciences reigns as the oldest and largest bureau in the western states to offer media conversion service (transferring of data information from one format to another).

Or it could be that Text Sciences is the nation's leader in electronic publishing, which enables books, forms, and specifications to be placed on a variety of diskettes.

Then again, maybe the corporation's unchallenged success can be attributed to DepoBank, a full-text information retrieval system that automates the searching, analysis, and summarization of testimony. According to Dana Breaugh, Text Science's marketing representative, "Each month DepoBank continues to sell better than the previous month, and in all likelihood it should become our largest selling service. It's a very impressive product."

Whatever the reason for the firm's remarkable

proficiency, there is no doubt that credit should be given to William Calfas, president of Text Sciences. He founded the company in 1979 and has been a member of the California Bar since 1958. His association with the legal profession has had an influence on Text Science's media conversion, electronic publishing, and DepoBank services. He explains, "Five years ago, I saw a significant problem —that whenever someone tried to change from one word and data processing system to another, they were confronted with all of this information. Surprisingly, this happened quite frequently, especially in the legal profession where court records are transferred from one division to another."

Text Sciences is the oldest and largest bureau in the western states to offer media conversion services. It's also the nation's leader in electronic publishing.

Shortly thereafter, Text Sciences was in business, and so was the development of its media conversion service. Calfas elaborates, "From our standpoint, we probably have the ability to connect from one system to another of one's choice. The media conversion enables the transfer of data between nearly 200 formats (which include systems by Apple, Wang, and IBM)."

In addition, single disks or entire libraries can be converted to or from these systems through media conversion. Although other alternatives to media conversion include re-keying or buying media conversion equipment, Calfas says that re-keying is expensive, as is purchasing media conversion equipment. "What we're doing, in effect, is saving businesses thousands of dollars through cost-efficient services."

In fact, the electronic publishing service is also economical because it eliminates hours upon hours of typing time. "Lawyers can quickly generate wills, real-estate, and other legal forms through our electronic publishing," Calfas says, again pointing out the impact that the legal profession has had on Text Science's developments.

Obviously, the DepoBank is no different, as lawyers, paralegals, and other litigation support personnel have found the information retrieval system beneficial. The DepoBank runs on the IBM PC, IBM-compatible, and other MS-DOS personal computers. It reduces costs by compacting over 1,000 pages of testimony on an ordinary (360 Kbyte) PC floppy disk, and over 25,000 pages on a (10 Mbyte) hard disk system. This format allows various DepoBank functions like key-word searching and reviewing testimony to be performed at an accelerated pace. Calfas says that DepoBank's compression ratio is about 3.5 to 1, or 1.2 million characters on an off-the shelf disk originally designed to hold a capacity of only 360,000 characters. Before DepoBank, the best compression ratio for consumers was only 1.8 to 1.

What is also unique about DepoBank is that its compact storage and extraordinary performance makes it the only full-text retrieval system that can conveniently access thousands of pages of testimony on ordinary personal computer systems.

Although Calfas says that Text Science's three major activities — manual conversion, electronic publishing, and DepoBank—have been significant to the company's substantial growth rate, he also points out that their first year in business was difficult in terms of selling their services. Calfas says, "We had just come out with the manual conversion service, and we're only one of two companies nationwide that offered it. You see, when you have a new product that is totally unique, people can become hesitant about buying it, since not many people know too much about it."

"What we're doing, in effect," says president William Calfas, "is saving businesses thousands of dollars through cost-efficient services."

Well, it seems that five years and some 20 billion characters later, Calfas can be content with his company's performance. Breaugh probably sums it up best by saying "We're ahead of our field in updating our format and developing new products. No one has the capabilities that Text Sciences has in terms of offering a wider range of products that deal with information processing—at least, no one that I know of."
